** Assistant Professor of Political Science, University of North Texas. We are grateful to Lawrence Baum, Victor Brudney, Ruth Colker, Bill Eskridge, Phil Frickey, Dean Lacy, Dale Oesterle, Steve Ross, and Peter Swire for insightful comments on an earlier draft of this article. Steve Barsotti, Patrick Brodhead, Sara DePaul, Rebecca Frihart, Shannan Katz, Brian Ray, Dan Riedl, and Sara Sampson provided excellent research support as well as valuable assistance in compiling the data base. Jennifer Pursell and Michele Whetzel-Newton furnished first-rate secretarial support. The Moritz College of Law contributed generous financial assistance. All remaining errors are ours.
Canons of Construction and the Elusive Quest for Neutral Reasoning

INTRODUCTION

Federal statutes, like the lawmaking enterprise itself, are seldom models of efficiency. Procedural complexities and practical constraints impose substantial pressure on legislators seeking to enact new laws. This pressure may produce inadvertent drafting oversights, or it may give rise to deliberate ambiguities around which a pro-enactment majority can form. Whether through inevitable laxity or conscious choice, Congress leaves a fair number of gaps in the meaning of its complex regulatory schemes. When filling those gaps with case-specific interpretive responses, federal courts perform an important policymaking function.

In recent years, such policymaking has generated increased concerns about the politicization of the judiciary. Plausible legal contentions tendered in a courtroom often reflect the ideological preferences of diverse interest groups. Scholars using social science techniques have contributed to the image of courts as policymakers, by establishing that judges’ political party affiliation and ideological orientation are at times significant predictors of voting

---

1 One recurrent example involves federal statutes that lack an explicit limitation period within which to initiate legal action. See North Star Steel v. Thomas, 515 U.S. 29, 33 (1995) (referring to numerous specific statutes). While there may be rare instances in which this decision is conscious and deliberate (see note 2 infra), it generally reflects simply insufficient attention to detail.

behavior. Presidents and senators have implicitly endorsed this image, through their sharp-edged insistence on scrutinizing candidates and nominees for ideological compatibility. Even some judges, by candidly discussing the role of personal beliefs and value judgments in their decisionmaking matrix, acknowledge a policy-oriented dimension to their interpretation of statutes, albeit as a junior partner in the lawmaking enterprise.

This emphasis on political values is difficult to reconcile with our prevailing conception that the legitimacy of courts derives in large part from the objective and transparent methods judges are thought to employ when reaching decisions. Notwithstanding a diverse chorus of dissenters, the traditional lawyerly account of judicial decisionmaking envisions a reasoned, ideologically neutral elaboration of text and its accompanying precedents. Judges themselves have tended to embrace this account. They recognize the role of discretion in deciding particular cases, especially at the appellate level, but insist that such discretion can be appropriately channeled through a more or less coherent reliance on statutory language, prior judicial decisions, and logical reasoning.

10 See Frank M. Coffin, On Appeal: Courts, Lawyering & Judging, 258-62 (1994); Shirley S. Abrahamson,
Underlying the tension between judges as value-promoting policymakers and judges as principled, impartial actors is the aspiration that judicial techniques of reasoning are or ought to be both reasonably predictable and outcome-neutral. This article explores in depth a central aspect of that aspiration, by examining the Supreme Court’s expressed reliance in recent years on one assertedly neutral reasoning technique—the canons of construction—in one area of substantive doctrine, the law of the workplace.

Our approach is both empirical and doctrinal. We rely on bivariate and regression analyses to illuminate how the canons have been used in our 630-case dataset—over periods of time, across different subject matter categories, by individual justices, and in closely contested cases. We then analyze individual opinions in some detail to assess several competing theoretical accounts of how the canons operate. Through this combination of methods, we evaluate the role that the canons have played in justifying the Supreme Court’s workplace jurisprudence.

Focus on the canons of construction is especially timely given that their use is experiencing a renaissance among judges and legal scholars. Judges, especially textualist-oriented judges, praise the canons for their relative clarity and common sense virtues. Public choice scholars view the canons as a valuable substitute for lack of judicial expertise and as a means of minimizing error costs. Legal process theorists defend the canons as “off-the-rack” interpretive rules that guide judicial discretion so as to render statutory meaning more

predictable. On the other hand, more pessimistic accounts suggest that the canons are being used strategically, to justify judicial policy preferences or to frustrate clear legislative intent. We consider each of these assertions or concerns about methodological utility, as well as the underlying issue of whether or to what extent reliance on the canons correlates with ideological positions embodied in the Court’s opinions.

Our database consists of every decision addressing workplace law matters since the start of the Burger Court era: 630 cases with written opinions from 1969 to 2003. For each case, we classified outcomes as liberal (basically pro-employee or union) or conservative (basically pro-employer) and identified the substantive statutory or constitutional provisions being interpreted and applied. Most important, for each case we coded the textual and contextual resources on which authoring justices expressly relied in their majority or dissenting opinions. Majority opinions depend upon the canons of construction as part of their reasoning in some 160 instances, more than one-fourth of all decisions.

Our results include some elements that might be readily anticipated and others that are unexpected. The Court’s reliance on both language canons and substantive canons in its

---

16 See Part II infra for discussion of how we constructed the database.

17 See Part II infra for discussion of our classification approach, including identification of the small number of cases with no ideological direction.

18 Language canons address grammar rules and the arrangement of words or phrases within a statute, in an effort to clarify the ordinary or common meaning of legislatively chosen text. Substantive canons reflect judicially perceived policy priorities related to the common law, statutes at some general level, or the Constitution. See Part I infra for further explanation of the distinction between these two categories of canons.
majority opinions has virtually doubled from the Burger to the Rehnquist eras, even as the Court’s reliance on legislative history has steadily declined. Dependence on the canons has not been uniform across all substantive areas of workplace law: for instance, language canon reliance has been especially frequent in opinions implementing minimum standards statutes and the employee benefits provisions of ERISA.19 Reliance on the canons also has varied considerably among justices. For example, the heaviest users of language canons in majority opinions include textualists such as Justices Scalia and Thomas but also pragmatists such as Justices Stevens and Blackmun. The latter, however, often combine invocation of canons with reliance on legislative history or statutory purpose, something that is rare among textualists.

Beyond their intrinsic interest, our findings shed light on certain claims made by legal scholars praising or doubting the canons’ role as neutral and predictable interpretive norms. There is some support for public choice proponents’ assertions that decisions interpreting complex and technical statutes, or resolving interpretive questions of a less ideologically charged nature, are more likely to involve language canon reliance. After analyzing several such decisions, however, we suggest that this reliance is best explained by reference to characteristics of the statutory provisions under review, rather than to the justices’ desire to avoid error or embarrassment.

Of greater import are our conclusions with respect to pessimistic contentions that the canons are being used to reinforce ideological predispositions, often at the expense of discoverable legislative purpose. Our findings indicate that canon usage by justices identified as liberals tends to be linked to liberal outcomes, and canon reliance by conservative justices to be associated with conservative outcomes. We also found that canons are often invoked to justify

conservative results in close cases—*i.e.*, those decided by a one-vote or two-vote margin. Indeed, closely divided cases in which the majority relies on substantive canons are more likely to reach conservative results than close cases where those canons are not invoked.

In addition, we identified a subset of cases in which the majority relies on canons while the dissent invokes legislative history: these cases, almost all decided since 1988, have yielded overwhelmingly conservative results. Doctrinal analysis of illustrative decisions indicates that conservative members of the Rehnquist Court are using the canons in such contested cases to ignore—and thereby undermine—the demonstrable legislative preferences of Congress. Taken together, the association between canon reliance and outcomes among both conservative and liberal justices, the distinctly conservative influence associated with substantive canon reliance in close cases, and the recent tensions in contested cases between conservative majority opinions that rely on canons and liberal dissents that invoke legislative history, suggest that the canons are regularly used in an instrumental if not ideologically conscious manner.

Finally, we discovered little evidence to support legal process scholars’ claims that the canons serve as consistent or predictable guides to statutory meaning. Our dataset includes a number of decisions in which both majority and dissent rely on canons, and we found that reliance on language canons is likely to be accompanied by dissent invocation of language canons, and majority use of substantive canons is similarly linked to dissent dependence on substantive canons. Such results suggest that the justices themselves are inclined to disagree about the clarity or predictability of canon-based reasoning. Doctrinal consideration of some of these “dueling canon” cases illustrates the malleability of both language and substantive canons, and demonstrates how reliance on the canons does relatively little to limit judicial discretion. Overall, our findings and analyses offer some sobering lessons regarding formalist claims that
the canons can promote either impartiality or consistency in judicial reasoning.

Part I of the Article briefly describes the canons’ role as an interpretive resource for courts, including the basic distinction between language and substantive canons. Part I also discusses the theoretical claims currently being made on behalf of the canons and identifies the three such claims that we will attempt to evaluate using our database. Part II relates the methods we used to assemble and analyze our database, including how we assessed judicial outcomes and how we coded different types of judicial reasoning. Part III presents our findings, using tables that reflect aggregate data as well as some description of individual approaches by different justices. Part IV pursues key aspects of our findings in doctrinal terms by analyzing certain illustrative decisions, and also situates our results in a broader context.

I. THE CANONS AS A FORM OF JUDICIAL REASONING

The phrase “canons of construction” is understood to encompass a set of background norms and conventions that are used by courts when interpreting statutes.\(^{20}\) While the Supreme Court recently referred to them as “simply rules of thumb which will sometimes help courts determine the meaning of legislation,”\(^{21}\) the reality of their use is more complicated. Federal judges regularly exercise broad discretion in deciding when the canons should apply, which ones to invoke in a particular setting, and how to reconcile them with other contextual resources such as specific legislative history, general statutory policy or purpose, and deference to agency determinations.

\(^{20}\) See generally Cass Sunstein, After the Rights Revolution: Reconceiving the Regulatory State 147 (1990); Eskridge and Frickey, supra note 12, at 65-67. Such background norms and conventions may also be applied to interpret common law sources or constitutions, but our primary focus here is on their use as part of statutory construction.

A. Descriptive and Normative Controversy

Canons or maxims of interpretation have an impressive pedigree. They were used as interpretive aids in a number of ancient legal and religious settings, and Anglo-American judges have relied on them for at least 400 years. Despite their durability, however, the canons have been controversial in the modern American context.

Professor Karl Llewellyn’s classic critique, in which he listed a countercanon for each of 28 canons, highlighted what he viewed as the canons’ radical indeterminacy. More generally, Legal Realists assailed the canons as insincere if not deceptive, because their mechanistic and acontextual approach ignored the presence of an “assumed purpose” that inevitably informs a judge’s interpretive enterprise. Contemporary scholars have echoed this refrain, observing that canons “presume...that a statute is primarily a linguistic artifact” when in fact statutory content and direction are distinctly purposive and value-laden.

Since 1990, a growing number of legal academics has sought to rehabilitate the role played by the canons in statutory interpretation. Starting from the premise that courts continue to say they rely on canons notwithstanding decades of withering scholarly reviews, Professor Cass

25 Id. at 400.
Sunstein maintains that the canons serve a valuable practical function. Understanding a congressional text inevitably involves accepting certain background principles, both about “how words should ordinarily be understood [and about] how regulatory statutes should interact with constitutional structure and substantive policy.” Professors William Eskridge and Philip Frickey build on this pragmatic approach, arguing that the canons further rule-of-law norms. Their accessibility as “off the rack, gap-filling” principles enhances the clarity of enacted law ex ante for drafters and ex post for interpreters. Certain canons also should be viewed as ordering mechanisms or “signaling devices”: because policy-related canons carry presumptive weight with the federal courts, they inform Congress that it must draft in clear and specific terms in order to trump the policy-related presumption.

In addition to these pragmatic and institutional process justifications, academics have explained the canons from a public choice perspective as serving the judiciary’s more strategic self-interest. Professors Jonathan Macey and Geoffrey Miller suggest that judges use canons, whether consciously or not, as a temporary expedient when they lack a policy-based justification for their decision. Assuming arguendo that judges develop personal policy preferences just as other political actors do, and that these preferences are an important motivating factor for judicial decisions, Macey and Miller contend that the canons come into play primarily in the unusual

31 Id. at 68-69. See Shapiro, supra note 12, at 943-45 (discussing canons’ role providing predictability and fair notice). See also Lori Hausegger & Lawrence Baum, Inviting Supreme Court Action: A Study of Supreme Court Motivations in Statutory Interpretation, 43 AM. J. POL. SCI. 162 (1999) (discussing Court’s willingness to signal Congress in majority opinions through invitations to reverse its statutory interpretation decisions.)
32 Macey & Miller, supra note 13, at 660.
circumstances when a judge has no preferred policy position. Such situations tend to arise because the judge has neither expertise nor strongly held convictions with regard to the subject matter area or substantive issue being litigated. Macey and Miller maintain that when a case involves complex and technical areas of the law, where judges generally have less knowledge and are not as concerned about the policy consequences, courts will rely more on the canons—as a content-neutral substitute for specialized expertise and as a means of avoiding errors that could have substantive law implications.

A third, and more pessimistic, assessment is that the canons are at times used by judges to frustrate the policy preferences of the legislature. Professor Stephen Ross contends that certain linguistic canons regularly invoked by conservative justices in recent years rest on the inaccurate presumption that Congress is an omniscient drafter. Some policy-related canons favored by the Rehnquist Court majority also have drawn fire for assuming an unrealistic level of congressional foresight. In concluding that Congress’s omission of a particular group from a protected list signals the group’s exclusion from coverage, or that Congress’s failure to be sufficiently explicit about state government liability means no such liability may attach, the Court may be ignoring clearly discoverable legislative purpose. For Ross and other skeptical scholars, the canons tend to serve as a façade, useful to support decisions that reflect judicial policy preferences

36 See Ross, supra note 15, at 572.
37 See William N. Eskridge, Jr., Philip P. Frickey, & Elizabeth Garrett, Cases and Materials on Legislation, 907-08 (3d. ed. 2001) (discussing effect of newly emphasized substantive canons in unraveling settled congressional expectations about how the Court would approach the political process).
notwithstanding a different congressional intent.\textsuperscript{38}

Controversy regarding the canons’ interpretive role has not been confined to the academy. Federal judges also have expressed divergent views about the value of the canons in statutory interpretation. Justice Scalia considers the canons—particularly those related to the grammar and structure of statutes—to be common sense rules of inference that serve as important guides to the meaning of legislative text.\textsuperscript{39} The fact that these canons may on occasion be overridden by contrary indicia of meaning, including other canons, simply indicates they are persuasive rather than conclusive. For Scalia, the existence of competing interpretive possibilities does not tarnish the canons’ dual role of making interpretation more predictable for parties and encouraging Congress to draft laws in a more consistent and precise manner.\textsuperscript{40}

Judge Posner, by contrast, is more skeptical about the canons, especially the language canons. He regards them as generally without value even when invoked as flexible guidelines or presumptions, because they are premised on “wholly unrealistic conceptions of the legislative process.”\textsuperscript{41} Given that Congress is far from omniscient in either its linguistic drafting process or its ability to appreciate policy problems that its legislative product will encounter, there is no adequate basis for invoking special rules of inference based on a presumed level of knowledge or

\textsuperscript{38} See Ross, supra note 15, at 562; Rubin, supra note 15, at 590. See also Shapiro, supra note 12, at 958-59 (expressing concern about such misuses which he views as episodic rather than systemic).

\textsuperscript{39} See SCALIA, supra note 14, at 25-27. Justice Scalia is less sanguine about canons that create default rules and presumptions of substantive policy, although he expresses support for some substantive canons as reflecting imbedded understandings about our constitutional structure. See id. at 28-29 (describing most substantive canons as “a lot of trouble. . .to the honest textualist” but defending canons that protect states’ sovereign immunity against congressional action because they are essentially variants on “normal interpretation”).

\textsuperscript{40} See id. at 27. See, e.g., Chisom v. Roemer, 501 U.S. 380, 404 (1991) (dissenting opinion) (describing role of canons in clarifying the ordinary meaning of text); Finley v. United States, 490 U.S. 545, 554 (1989) (applying canon to invite Congress to draft clearly when it wishes to make a substantive change from settled textual meaning).

foresight. Posner understands that judges continue to rely on the canons “to give [their] opinion[s] the form of logical deduction,” but he objects to the way canons disguise the creative aspects of statutory construction by presenting the interpretive process as essentially mechanical.

One instructive aspect of these often heated debates is that so many scholars and judges believe the canons perform important interpretive functions, even as they differ regarding the precise nature of such functions. It is claimed that judges are not simply invoking the canons to support a result otherwise suggested, they are continuing to rely on them as an integral part of the ratio decidendi that drives results in majority and dissenting opinions.

Admittedly, discovering whether judicial reliance expressed in a written opinion actually determines or even contributes to the underlying result is no mean feat. For close statutory cases that can plausibly be justified in either direction, a conscientious judge generally has available many reasoned arguments, derived from a range of interpretive resources. The weight or priority the judge gives to each interpretive resource in arriving at a coherent, principled outcome will at times be shaped by individual values or policy preferences. The fact that such preferences are often subconscious makes it that much harder to unravel the precise role played by resources like the canons, even when the judge deems them principal as opposed to cameo performers.

We are aware of this difficulty, and we do not attempt to calibrate the complex mixture of

---

42 Id. at 279-82. Posner does see some merit in certain substantive canons. See id. at 283-85 (discussing Rule of Lenity and canon of constitutional avoidance).

intellectual reasoning and personal value judgments that contribute to judicial opinions relying at least in part on the canons. Rather, our objectives involve identifying patterns or trends of expressed reliance on the canons in the Court’s workplace law opinions, and considering whether those patterns support or undermine the leading theorized accounts of how the canons operate.

B. Language Canons and Substantive Canons

A further notable characteristic of the canons is that these background interpretive guides are far from monolithic. They operate in distinctive ways and are justified in varied normative terms. Some canons address the uncertainty inherent in all written language, while others respond to the innate tensions between creation and implementation of legislative directives. Canons have been identified as techniques for clarifying the ordinary meaning of text, assuring continuity in the law, respecting constitutional principles such as federalism and due process, and enhancing the policies that underlie certain federal statutes.45 While scholars have classified the canons’ functions and goals in numerous ways,46 we have chosen to follow the prevailing taxonomy that divides the canons into two basic categories: linguistic and substantive.47

Language canons consist of predictive guidelines as to what the legislature likely meant

45 See Eskridge, Frickey & Garrett, supra note 37, at App. B (listing over 100 canons derived from Supreme Court opinions in 1986 through 1993 Terms).
46 See, e.g., Sunstein, supra note 20, at 150-56 (grouping the canons into four basic functional categories: those that clarify statutory meaning, those that illuminate interpretive instructions from the legislature, those that promote better lawmaking, and those that serve a judicial, constitutional, or common sense substantive purpose); Eskridge & Frickey, supra note 12, at 66-69 (describing the canons as serving rule-of-law purposes such as clarity and predictability, and institutional coordination purposes such as distributing certain decisional power to the courts and signaling judicial preferences for specific policy priorities.
47 See Shapiro, supra note 12, at 927-941 (explaining this dichotomy in some detail and with examples); Eskridge, Frickey & Garrett, supra note 37, at 819-36, 848-54, 873, 889 (same). See also Ross, supra note 15, at 563 (summarizing basic distinction between descriptive canons, which are guidelines to legislative intent based on particular uses of language, grammar, or syntax; and normative canons, which advise legislators that ambiguous text will be construed in favor of certain judicially crafted policy objectives); Patricia M. Wald, Some Observations on the Use of Legislative History in the 1981 Supreme Court Term, 68 Iowa L. Rev. 195, 207 (1983) (same).
based on its choice of certain words rather than others, or its grammatical configuration of those
words in a given sentence, or the relationship between those words and text found in other parts
of the same statute or in similar statutes.\textsuperscript{48} These canons do not purport to convey a judge’s own
policy preferences, but rather to effectuate the ordinary or common meaning of the language
enacted by the legislature, which in turn is understood to promote the actual or constructive
intent of the legislature that enacted such language.\textsuperscript{49} The language canons most often invoked
by the justices in workplace law decisions during this period are the Whole Act Rule and its
various permutations, suggesting that each term or provision should be viewed as part of a
consistent and integrated whole,\textsuperscript{50} and the \textit{expressio unius} maxim, under which the inclusion of
one term or concept in text suggests the exclusion of opposite or alternative terms and concepts
not mentioned.\textsuperscript{51} Other frequently used language canons are the \textit{in pari materia} guideline, which
presumes that similar statutes should be interpreted similarly and also that Congress uses the
same term consistently in similar statutes,\textsuperscript{52} and the \textit{ejusdem generis} maxim, under which a
general term is understood to reflect the class or type of objects identified in more specific terms
as part of the same sentence or provision.\textsuperscript{53}

Substantive canons, unlike their linguistic counterparts, \textit{are} generally meant to express a

related \textit{noscitur a sociis} canon).
judicial policy preference. They are not predicated on what the words of a statute should be presumed to mean, or what a rational Congress presumptively must have meant when it chose to use them. Rather, substantive canons reflect judicially-based concerns, grounded in the courts’ understanding of how to treat statutory text with deference to judicially perceived constitutional priorities, pre-enactment common law practices, or specific statutorily based policies. These judicially articulated values serve as presumptions that can be rebutted by sufficiently weighty evidence of contrary meaning found in text and sometimes in legislative history or purpose. Substantive canons may function as mere tiebreakers, but in recent years they often have been heavier weights on the interpretive scale, especially when the Supreme Court has characterized them as “clear statement” rules that can be rebutted only by express language in statutory text. Substantive canons often relied on by the Court as justifications in this workplace law setting include the need to avoid interpretations that would jeopardize a statute’s constitutionality; the clear statement rule against federal abrogation of the states’ Eleventh Amendment immunity; the presumption against federal preemption or disruption of traditional state functions; and the presumption against a waiver of the United States’ sovereign immunity.

---

C. Three Theorized Accounts

Given the basic dichotomy between language canons and substantive canons, we present our results and discussion in Part III mostly through separate analyses of the justices’ reliance on these two types of interpretive guides. In addition, we follow up on some of our results in Part IV, in order to consider the persuasiveness of three distinct theoretical approaches to describing or justifying the Court’s canon reliance.

First, we address the explanatory model offered for the canons by public choice scholars Macey and Miller. We explore certain ways in which the language canons are invoked by majority authors to resolve more technical statutory disputes, in relatively non-ideological statutory settings. We also consider whether these aspects of canon reliance are attributable to the justices’ lack of expertise or ideological investment, or are better explained by reference to other factors.

Second, we examine the pessimistic assertions by Ross and Rubin, among others, that the Court uses canons to undermine discoverable legislative intent. Here, we focus on disagreements within the Court that reflect tensions between majority reliance on canons and dissent dependence on legislative history. In cases where such tension exists, is there a predictable ideological direction? If so, is this ideological tilt best understood by reference to the use of particular types of canons, or to specific subject matter areas before the Court, or to the opinion-writing of certain justices?

60 There will, of course, be occasional difficulty in drawing lines at the edges between the two categories. We follow custom in referring to the Whole Act Rule as a language canon even though references to overall statutory structure and the need to avoid surplusage at times may implicate substance. Similarly, we classify the canon that repeals by implication are disfavored as substantive even though its policy promoting continuity between statutes may not seem terribly different from the *in pari materia* language canon’s promotion of consistency between statutes. But cf. Morton v. Mancari, 417 U.S. 535, 548-50 (1974) (ticking implied repeals to considerations of judicial respect for congressional intent and purpose). Still, the fundamental distinction is clear between canons that profess only to clarify the text (and therefore meaning) approved by Congress, and canons that promote judicially
Finally, we take cognizance of the pragmatic claims made on behalf of the canons by modern scholars like Sunstein, Eskridge and Frickey, and Shapiro. In order to understand if the canons in fact function as “off-the-rack gap-filling rules” to promote interpretive continuity, we examine the extent to which their use can be deemed consistent and ideologically neutral. Particularly when both majority and dissenting opinions invoke the canons, we consider whether the Court’s patterns of reliance enhance clarity, and whether they serve as constraints on arbitrary judicial action.

II. ASSEMBLING AND ANALYZING A DATABASE

A. Identifying and Classifying Workplace Law Cases

Based on a review of Supreme Court decisions since the start of Chief Justice Burger’s tenure in the fall of 1969, we have identified 632 cases with published opinions that directly address some aspect of the employment relationship. The cases were compiled initially through a series of searches in the Westlaw FLB-SCT database keyed to numerous titles and sections of the U.S. Code. We also have relied on U.S. Law Week end-of-term summaries and on the annual review of Supreme Court labor and employment decisions, appearing in THE preferred policy positions.

61 Our dataset includes all cases decided by written opinion (signed or per curiam) from December 1969 through June 2003, a span of 34 Supreme Court terms. It does not include opinions written as part of the initial disposition of a certiorari petition. It also does not include affirmances without opinion by an equally divided vote; see, e.g., Board of Education of Oklahoma City v. National Gay Task Force, 470 U.S. 903 (1985).

62 Brudney began this project in 2000, and he secured initial and updated lists with the skilled help of Brian Ray and Rebecca Frihart, research assistants and now graduates of The Ohio State University Moritz College of Law. A memorandum detailing the search methods used to generate initial case lists for 1969-1999 is on file with the authors. The search methods yielded far more than the current number of cases; Brudney’s review of Westlaw summaries allowed him to eliminate cases citing the searched for code sections that did not directly involve the employment relationship. Selection of relevant cases required exercising only a minimal amount of discretionary judgment; the great majority of decisions were not borderline.
LABOR LAWYER since the 1983 term, to supplement and cross-check our electronic search.\(^{63}\)

Our dataset focuses on controversies that affected employees in their status as employees. In almost all instances, these disputes implicated the relationship between employees and employers, unions and employers, or unions and employees. Occasionally, our cases feature workplace-related disputes that involved the government or another third party, as in decisions concerning the immigration effects or tax consequences of an employment-based event.\(^{64}\) We have not included cases that may have employment law implications but do not themselves arise in the employment context. While some of these cases may have had a substantial impact on the subsequent direction of labor and employment law,\(^{65}\) we found it more practicable—and less subjective—to classify based on the presence of a workplace nexus rather than the anticipated relevance of an education or voting rights or attorney’s fees decision.

The 632 cases we have identified represent a remarkably stable portion of the Supreme Court’s overall decision docket. To be sure, the number of workplace law decisions has fluctuated considerably between terms.\(^{66}\) Still, measured in three year intervals, these decided cases have constituted roughly one-sixth of the Court’s docket on a consistent basis since the mid

---

\(^{63}\) For cases decided in the past three terms, we have relied primarily on case reviews and summaries from *U.S. Law Week*. The annual review that appears in THE LABOR LAWYER is compiled and presented by the Secretary to the American Bar Association Section on Labor and Employment Law, a position occupied by different labor and employment law professors on an annually rotating basis.

\(^{64}\) See, e.g., INS v. Nat’l Ctr. for Immigrant’s Rights, 502 U.S. 183 (1991) (holding that agency regulation requiring release bonds for excludable aliens to contain “condition barring employment” pending deportability determination is valid exercise of statutory authority); United States v. Cleveland Indians, 532 U.S. 200 (2001) (holding that salary-based damages paid to professional baseball players for employer misconduct occurring in previous years are taxable for the year the damages are actually paid).

\(^{66}\) The range is from a high of 33 in the 1981 Term to a low of 7 in the 1999 Term. See generally James J. Brudney, *The Changing Complexion of Workplace Law: Labor and Employment Decisions of the Supreme Court’s 1999-2000 Term*, 16 THE LAB. LAW. 151, 152-64 (2000) (providing overview of Court’s workplace law docket from 1969-
1970s.\textsuperscript{67} It is notable that this workplace law proportion has held steady even though the Court’s overall number of decisions has plunged by over 50\% since the early 1980s.\textsuperscript{68} Moreover, the level of interest has persisted over nearly 30 years despite major social and economic developments outside the workplace, shifting ideological priorities among the justices, and substantial changes in Justice Department and interest group litigation agendas. This impressive stability presumably reflects the enduring importance of work in our modern culture. It also indicates the Court’s interest in continuing efforts by Congress and the President to provide a range of legal protections for employees, while accommodating those redistributive preferences to certain privileges asserted by employers.

Federal law imposes a kind of structure on the American workplace through the large number of statutory and constitutional provisions that create and condition the enforceable rights of workers. For subject matter purposes, we have classified our 632 cases into eight main groupings. Seven of these categories cover claims related to various statutory schemes or provisions: (i) labor-management relations statutes,\textsuperscript{69} (ii) race or sex discrimination provisions,\textsuperscript{70}

\textsuperscript{67} See id. at 152-53, (discussing workplace law ratio from 1969 through 1999 term). In the past three terms (2000 to 2002), the Court issued 226 signed or per curiam opinions deciding cases after oral argument. See LEE EPSTEIN ET AL., THE SUPREME COURT COMPENDIUM: DATA, DECISIONS & DEVELOPMENTS, TABLE 2-11, 82-84 (3d. ed) (2003); 72 U.S.L.W. 3079 (July 15, 2003) (identifying number of majority opinions for 2002 term.) Of these opinions, 42, or 18.6\% addressed workplace law matters.

\textsuperscript{68} See Brudney, supra note 66, at 152 (contrasting average of 153 decided cases per term in 1981-83 with average of 86 cases per term in 1996-99, a drop of 67 or 44\%). The Court’s average for the 2000, 2001, and 2002 terms has been 75 cases, a decrease of 51\% from the 1981-83 average.

\textsuperscript{69} This category includes the National Labor Relations Act of 1935, the Labor-Management Relations Act of 1947, the Labor-Management Reporting and Disclosure Act of 1959, the Railway Labor Act, the Norris-LaGuardia Act, the Federal Service Labor Management Relations Act of 1978, and a smattering of other provisions that gave rise to labor-management or union-employee conflicts.

\textsuperscript{70} Such claims arose primarily under Title VII of the 1964 Civil Rights Act, but also under the Equal Pay Act of 1963 and under the Civil War era statutes (42 U.S.C. §§ 1981, 1983, 1985). Race or sex discrimination cases implicating constitutional provisions (chiefly Fourteenth Amendment and Fifth Amendment) are covered here as well.

20
(iii) provisions involving other forms of status discrimination, such as age or disability,\(^71\) (iv) laws creating minimum employment standards or compensation levels,\(^72\) (v) retirement-related statutes,\(^73\) (vi) general negligence-based provisions that apply mostly to workers in the railroad or maritime industries,\(^74\) and (vii) miscellaneous employment-related provisions.\(^75\) The eighth category consists of decisions that implicate provisions of the U.S. Constitution.\(^76\) Within each of these eight workplace law areas, we have done additional coding based on the particular statutory scheme or constitutional provision involved.\(^77\)

**B. Coding Opinion Results and Individual Justices in Ideological Terms**

Our effort to evaluate political neutrality or ideological direction is grounded in our coding of judicial outcomes. For all cases, we determined whether the Court’s legal result

---

\(^71\) This category includes the Age Discrimination in Employment Act (ADEA), the Americans with Disabilities Act (ADA), § 504 of the Rehabilitation Act, the Civil War era statutes when invoked to allege discrimination based on factors other than race or sex, and statutes alleging discrimination against veterans.

\(^72\) This category includes the Fair Labor Standards Act (FLSA), the Longshore and Harbor Workers Compensation Act, the Occupational Safety and Health Act, and the Mine Safety and Health Act, as well as many other laws addressing basic terms and conditions of employment that arose only once or twice as the focus of Court decisions.

\(^73\) This category refers primarily to ERISA, but it also includes some cases applying specialized federal retirement statutes that affect civil service employees, railroad employees, coal industry employees, and military employees.

\(^74\) This grouping includes the Jones Act, the Federal Employers’ Liability Act (FELA), the Federal Tort Claims Act, general admiralty law, and also state tort law when applicable.

\(^75\) This most disparate category encompasses employment-related disputes that arise in connection with antitrust law, immigration law, criminal law, tax law, social security law, and various other areas.

\(^76\) Many of these cases present issues under the First Amendment or the equal protection or due process clauses of the Fourteenth Amendment, although there also are decisions involving the Fourth, Seventh, Tenth, and Eleventh Amendments as well as other constitutional provisions. When a majority opinion involved interpretive reasoning that implicates both constitutional and federal statutory provisions (such as a First Amendment challenge to a federal statute regulating employer speech or union picketing) we included it in both subject matter categories. This occurred in about 9% of all cases (55 total). Further, in about 2% of the cases (13 total), the Court analyzed two issues in distinct areas of federal workplace law (e.g., the court took certiorari on and resolved both an NLRA and an ERISA issue); here again, we included the case in both subject matter categories. We did not double count these “two substantive category” cases in any other respect, e.g., they count as a single case when coding decision results and also when coding the opinions of individual justices.

\(^77\) For example, a case decided in the area of labor-management relations will be further classified based on whether it involved the NLRA, LMRA, LMRDA, Norris-LaGuardia Act, etc. A copy of the Codebook identifying subject matter categories, including specific subcategories for each of our eight subject matter groupings, is on file with the
favored employees or employers. In 90% of the cases this was a fairly straightforward process, because the interests of employees or unions as grievants were pitted against the interests of employers. Further, the employee or union sought to vindicate a congressionally provided or constitutionally conferred right, or the employer invoked a statutory defense or constitutional interest of its own, such that the outcome was readily classifiable as either pro-employee or pro-union—referred to here as liberal—or pro-employer—referred to as conservative.  

Some ten percent of the cases (67 total), however, were anomalous. These decisions either involved “reverse discrimination” issues in which a non-minority or a male employee asserted rights to equal treatment, or they involved disputes between employees and unions in which individual workers alleged some form of union misconduct under a federal statute or the Constitution. We coded the reverse discrimination decisions as liberal if the outcome favored the class or group that was the primary intended beneficiary of the statutory or constitutional provision. For the disputes between individual employees and unions, we coded some cases

---

78 We apply the terms “liberal” and “conservative” in this workplace and civil rights-related area of law and public policy; the terms may have a somewhat different connotation in other policy areas such as business regulation or international affairs. Employee-employer conflicts typically involved disputes over employee claims for reinstatement or compensation under Title VII, the ADEA, other employee protection statutes, or even the Fourteenth Amendment. Union-employer conflicts regularly involved contests over union attempts to engage in organizing or collective bargaining under the NLRA, the RLA, or related statutes. Employers on occasion asserted their own rights, either as defenses to liability or as claims for compensation. See, e.g., Employees of Dep’t of Pub. Health of Mo. v. Dep’t of Pub. Health of Mo., 411 U.S. 279 (1973) (employer asserts successful sovereign immunity defense); Eastern Enterprises v. Apfel, 524 U.S. 498 (1998) (employer asserts successful claim under Fifth Amendment Takings Clause). In a very small number of cases, the Court’s decision was sufficiently divided in outcome between employees and employer that we did not code the majority opinion as either liberal or conservative.

81 Thus, the Weber and Johnson outcomes are coded liberal because the Court ruled in favor of the interests of racial minorities and women, even though the individual white male employees in each case ended up as losing parties.
Based on ideological outcome but more often we were unable to identify the Court’s decision as liberal or conservative given the nature of the conflicting interests.\textsuperscript{82}

Besides coding judicial outcomes, we also identified each of the 19 justices who served during this period as either liberal or conservative.\textsuperscript{83} In making these determinations, we relied on voting scores derived from a data base compiled by Professor Harold Spaeth, whose work analyzing Supreme Court voting behavior is well recognized.\textsuperscript{84} Several of Spaeth’s designated policy areas, combined together, provide a distinctively formulated yet comparable subject matter category to our workplace law dataset.\textsuperscript{85} Based on voting scores for those policy areas,\

\textsuperscript{82} When individual rights were aligned with traditional civil rights-related concepts (e.g., individual employees alleging race or sex discrimination against the union, or asserting a right to intervene in a lawsuit or to be certified as a class), we coded results as liberal (pro-employee) and conservative (pro-union). But when individual employee rights directly impinged on the rights of a union majority that had taken a democratically supported position (e.g., disciplining an individual for crossing a picket line in violation of the union constitution, or seeking to collect agency fees from bargaining unit members to support union-approved lobbying or organizing efforts), we concluded that the result did not line up in traditional liberal-conservative terms. Finally, there were a handful of cases in which the direct policy implications seemed to us too close to call (e.g., is it “conservative” to prohibit punitive damages against a union? Is it “conservative” to allow a newly elected union president to discharge appointed business agents who opposed him in the election?). In the end, we omitted 37 of the 58 union-employee conflict decisions from our ideological results coding. When combined with the small number of decisions that were truly divided in outcome (see n. 78 supra) there are 48 out of 632 total decisions that are not coded for results in ideological terms.

\textsuperscript{83} The 19 justices include five who served only on the Burger Court (Justices Burger, Black, Harlan, Douglas, and Stewart), six who served only on the Rehnquist Court (Justices Scalia, Kennedy, Souter, Thomas, Ginsburg, and Breyer), and eight whose tenure spans both eras (Justices Powell, Brennan, Marshall, White, Blackmun, O’Connor, Stevens, and Rehnquist).

\textsuperscript{85} We needed to obtain ideology scores for the justices individually, and the Court as a whole, that were not endogenous to our dataset but that still captured the potential ideological differences between workplace law decisions and the aggregate of cases. We employ an ideology score derived from each justice’s votes through the 1999-2000 term (including votes prior to 1969) on a subgroup of issues in the Spaeth database. The issues include all civil rights issues (Issue variable codes in 200s and 300s), all union-related issues (Issue variable codes 553 to 599), and selected economic issues (Issue variable codes 601, 605, 611, 621, 631, and 636). The civil rights issues are modestly overinclusive in that they contain cases dealing with voting rights, education, and general poverty law as well as employment. The combined issue codes are also mildly underinclusive in that certain other issue codes represent policy areas (e.g., First Amendment, due process, Federalism) that contain some employment-related subjects. Still, the Spaeth combination of issue codes has substantial overlap with our employment-based dataset, and in screening out a number of potentially distorting or conflating policy areas (e.g., criminal law, judicial power,
we identify eight justices as conservatives and eleven as liberal.\textsuperscript{86} There is a close correlation between voting behavior in our dataset and in the larger Spaeth collection of civil rights-unions-economic issues, although some differences exist between the two.\textsuperscript{87}

\textsuperscript{86} Justices are coded as liberal or conservative by using simple directional analyses keyed to the proportion of liberal votes. The eight conservatives (Justices Harlan, Burger, Powell, O'Connor, Scalia, Kennedy, Thomas and Rehnquist) voted for individuals (against employer, business, or government-related positions) less than 50\% of the time; the other 11 justices cast pro-individual employee votes in more than 50\% of the cases. When relying on judicial classifications in our analyses, we focus primarily on five Rehnquist Court conservatives and eight long-serving liberals, with the six other justices grouped in a reference category. We also conduct similar analyses distinguishing conservative and liberal justices simply based on the intensity of their Spaeth vote scores, grouping moderate-voting justices (45-55\% for employees) as our reference category. \textit{See} Table X and nn.196-97 \textit{infra}; Table XII and n.213 \textit{infra}.

\textsuperscript{87} The voting scores listed below reflect the percentage of cases in which a justice cast votes favoring the legal position of individuals, employees, or unions; a score above 50\% is characterized as liberal. We present vote scores based on the Spaeth issue codes (\textit{see} note 85, \textit{supra}) side-by-side with scores based on our own dataset; we include in parenthesis the number of ideologically identified votes cast by each justice.
Returning to case outcomes in our workplace law dataset, it is worth noting that the decisions over this 34 year period are quite evenly divided in ideological terms. Of the 584 cases for which we coded such outcomes, 301 (51.5%) were liberal decisions while 283 (48.5%) were conservative. Although employees and unions fared slightly better before the Burger Court than they have before the Rehnquist Court, the difference is not significant.  

Several factors may contribute to this impression of ideological neutrality, an impression somewhat at odds with the Court’s conservative reputation in recent decades. First, given the

For 13 of the 19 justices, there is less than a 5% difference between our voting scores and Spaeth’s scores. For three justices (Kennedy, White, Stewart) the difference is between 5% and 10%, and for three justices (Scalia, Thomas, Breyer) it is between 10% and 15%. Only one of the 19 justices has a differential that changes his characterization: Justice Stewart’s Spaeth “label” (liberal) is at odds with his voting record in our dataset.

88 See n.82 supra.

89 In the Burger era, 53.9% of decisions were liberal while in the Rehnquist era it has been 48.7%; the difference is not statistically significant. The use of “significant” refers to results that are statistically significant using either the t-test or the z-test as appropriate based on the sample size. A t-test compares the mean of two samples or sets of data, controlling for the sample size, to determine whether the difference between the statistics could be due to chance. A result that is significant at the .05 level (t = .05) has no more than a 5% chance of occurring purely as coincidence. See R. MARK SIRKIN, STATISTICS FOR THE SOCIAL SCIENCES 178-89 (1995). All statistical analyses in
higher likelihood that disputes will be litigated (as opposed to settled) in close cases, parties’ win rates as a general matter may tend to be comparable over an extended period.\textsuperscript{90} The prospects for such comparability are likely enhanced when the parties can present plausible legal contentions before an appellate court that exercises purely discretionary jurisdiction.\textsuperscript{91}

Second, using individual case outcomes to report the Court’s ideology does not account for the ambition or aspirations that underlie the cases being brought. Conservative justices can appear more liberal if they accept and then resolve disputes in which pro-employee votes were relatively easy to cast.\textsuperscript{92} In the labor relations and employment discrimination areas, the business community doubtless plays a larger role in presenting the Justices with “hard cases” than it did in the Warren Court years, or even the early Burger Court era. Conversely, the civil rights community’s role during the Rehnquist era has been distinctly more subdued in this regard. Assuming, as is likely, that employers in recent decades have pushed the envelope of what they view as a sympathetic Court, their win-loss rate is in part attributable to their having pursued a more ambitious agenda.

Finally, our aggregate outcome data do not measure the magnitude of Supreme Court decisions. For instance, by weighing a union loss in a major case the same as a union win in a

\textsuperscript{91} As a rough analogy, the Harvard Law Review reported that for the 1991 through 2001 terms, the Court decided a total of 67 state criminal law cases, 35 won by the state government and 32 by the criminal defendant. These results are presented in Table III (Subject Matter of Dispositions with Full Opinions), found in the very back of issue one (the annual Supreme Court review issue) of volumes 106 through 116.

\textsuperscript{92} See Lawrence Baum, \textit{Measuring Policy Changes in the Rehnquist Court}, 23 AM. POL. Q. 373 (1995) (concluding that early Rehnquist Court’s record of outcomes in civil liberties cases overstated support for civil liberties because Court in this period increasingly accepted cases in which pro-civil liberties votes were relatively easy to cast). See generally Gregory A. Caldeira & John R. Wright, \textit{Organized Interests and Agenda Setting in the U.S. Supreme Court}, 82 AM. POL. SCI. REV. 1109 (1988) (finding that justices are significantly more likely to grant review when
minor case, our “box score” cannot assess the impact in policy terms of wins and losses over time. One way to recognize the ambition and magnitude factors referred to here is by focusing on decisions in closer cases, as opposed to unanimous or near-unanimous decisions. We present some results under this approach in Part III below.

C. Coding Interpretive Reasoning in the Justices’ Opinions

In order to examine the rationales for each written opinion in our dataset, we identified ten distinct interpretive resources on which the Court relied with some frequency. These are as follows: (1) the meaning of the textual language, including related appeals to plain or ordinary meaning; (2) dictionaries; (3) language canons; (4) legislative history (including specific interest groups file amicus curiae briefs supporting certiorari).

93 Compare, e.g., Lechmere Inc. v. NLRB, 502 U.S. 527 (1992) (major conservative outcome, restricting non-employees’ access to employer premises during organizing drive) with Auciello Iron Works, Inc. v. NLRB, 517 U.S. 781 (1996) (minor liberal outcome, reaffirming settled law regarding proper time during contract negotiation when employer may express good faith doubt as to union’s continued majority status).

94 Brudney used four law student research assistants (RAs) over an 18-month period to code judicial reasoning in the first 622 cases. He worked with a fifth RA to code the 10 cases decided in the 2002 Term. To minimize the risk of subjective or inconsistent results, he gave each RA a memorandum on coding categories and judgments. He also assigned cases by term, with terms spaced at sufficient intervals so that the four principal RAs (each of whom reviewed between 114 and 198 cases) coded a sizable number of cases decided in the 1970s, 1980s, and 1990s. This reduced the possibility that any individual coder would encounter a greater concentration of one form of reasoning that may have dominated a particular justice’s approach, or the Court’s overall thinking, during a given period. For each case, an RA filled in a detailed coding sheet. Brudney then analyzed each case separately, and reviewed all coding sheets, proposing occasional revisions that were discussed with the RA on a case-by-case basis at weekly meetings. While Brudney made the final determinations, consensus was reached in virtually all instances. Copies of the memorandum on coding interpretive reasoning as well as the coding sheet are on file with the authors. The substance of the memorandum is incorporated into the Codebook (see note 77 supra), also on file with the authors.

In order to check for intercoder reliability, we conducted Tau-B tests to compare the decisions made by each principal coder against the other three for all ten judicial reasoning variables. See generally J. Richard Landis & Gary G. Koch, The Measurement of Observer Agreement for Categorical Data, 33 BIOMETRICS 159 (1977). The Tau-B test evaluates whether there is a statistically significant difference in the mean score assigned by each coder against the other coders. The results indicate that with one minor exception, there are no significantly different codings on any variable. The exception involves the Supreme Court precedent variable (not a focus of this article), which one of the coders was slightly less likely than the other three coders to count as either affirmatively probative or a determining factor.

Notwithstanding the safeguards taken, classification of judicial reasoning inevitably involves the exercise of discretionary judgment. We believe that our standardized approach and readiness to resolve all disagreements between coders on a case-by-case basis has made the coding process as objective as possible. While we have little doubt that another set of readers might apply our ten categories slightly differently in individual instances, we also
references to committee reports, floor debates, hearings, and the Framers’ history for constitutional provisions); (5) legislative purpose (including general references to what Congress meant to accomplish, or the mischief aimed at, and policy justifications imputed generally to a statute or constitutional provision); (6) legislative inaction (including congressional silence after intervening Court decisions and also traditional appeals to “dogs that don’t bark”); (7) Supreme Court precedent; (8) common law precedent (including the background status of common law at time of enactment and specifically applicable common law principles); (9) substantive canons; and (10) agency deference.95

When reviewing each majority opinion, we identified the interpretive resources being invoked and then determined whether a resource was (i) merely referenced without being relied upon, including resources mentioned as part of preliminary or background discussion and also resources distinguished as substantively unhelpful; (ii) relied upon as affirmatively probative to help the majority reach its result; or (iii) relied upon as “a” or “the” determining factor in the majority’s reasoning process.96 Virtually every opinion for the Court has at least two resources

95 We omitted some items that were referred to only infrequently, such as law review articles, treatises, and amicus curiae briefs. Our classification scheme includes both similarities to and differences from approaches taken by other scholars. See, e.g., n.99 infra. See generally Jane S. Schacter, The Confounding Common Law Originalism in Recent Supreme Court Interpretation: Implications for the Legislative History Debate and Beyond, 51 STAN. L. REV. 1 (1998); Daniel M. Schneider, Empirical Research on Judicial Reasoning: Statutory Interpretation in Federal Tax Cases, 31 N. MEX. L. REV. 325 (2001).

There has been a recent upsurge of interest in attempting to analyze judicial reasoning from an empirical perspective. In addition to the articles by Schachter and Schneider, see generally Lee Epstein et al., Judging Statutes: Thoughts on Statutory Interpretation and Notes for a Project on the Internal Revenue Code, 13 WASH. U. J.L. & POL’Y 305 (2003); Robert M. Howard & Jeffrey A. Segal, An Original Look at Originalism, 36 LAW & SOC’Y REV. 113 (2002); Daniel A. Farber, Do Theories of Statutory Interpretation Matter? A Case Study, 94 NW. U. L. REV. 1409 (2000); Gregory C. Sisk et al., Charting the Influences of the Judicial Mind: An Empirical Study of Judicial Reasoning; 73 N.Y.U. L. REV. 1377, 1434-50, 1493-98 (1998). Our approach, identifying ten different interpretive resources, coding expressed reliance (rather than mere reference) for each of those ten resources, and linking that reliance to ideological outcomes, is especially ambitious.

96 We coded each resource as a 1, 2, or 3 based on degree of reliance; any resource not referred to at all in the analysis sections of an opinion was coded zero.
identified as either probative or determining, and the vast majority have three or more resources so identified. For purposes of this article, we focus on resources that are either probative or determining: in both instances the resource contributes in a meaningful way to the majority justification for its holding.

We found that the most important, and at times difficult, distinction to make regarding degree of probative value was between reference and reliance. Majority opinions often invoke resources such as legislative purpose, canons, or agency deference when using these resources in essence as foils or strawmen, because the majority is dismissing the value ascribed to them by a lower court, or by a party’s brief, or by a dissenting justice. Although these resources are in one sense being discussed as appropriate reasoning assets, the opinion author has not relied on them as positive support for the argument that leads to the Court’s holding. We concluded that focusing on an interpretive resource’s integral role in the majority’s affirmative reasoning process would allow us to cast the sharpest light on the Court’s principled justification for its decision. Moreover, in order to examine the relationship between principled justifications for the Court’s decisions and the ideological direction of those decisions, we needed to focus on resources that advanced the direction chosen by the majority.

---

97 Majority opinions relying on only one resource comprise fewer than five percent of the dataset; majority opinions relying on two resources comprise another eight percent of the decisions. Many of these “low resource” opinions were unsigned: 17 of the 22 *per curiam* majority opinions in our dataset relied on no more than two resources.

98 Under our coding scheme, there is considerable variation in the architecture of majority opinion reasoning. Many opinions contain multiple 2s but no 3s, many others have one 3 and several 2s, and some majority opinions are coded with two 3s; the latter generally occurs when the Court must resolve two distinct sub-issues to reach its conclusion.

99 Ours is certainly not the only plausible methodological approach to coding judicial reasoning. Professor Schacter, analyzing decisions from a recent Supreme Court term, distinguished between opinions that made substantive use of an interpretive resource—even if the opinion author derived no guidance from the resource she considered—and an author’s mere citation of the resource when setting forth the procedural history of the case. *Schacter, supra* note 95, at 12-13. Schacter, however, was not coding judicial outcomes, and her substantive-procedural dichotomy does not distinguish between substantive uses of a resource which the opinion author supports and substantive uses the author rejects as unpersuasive, inconclusive, or even incorrect. Because we seek to examine the relationship between
Two examples may be helpful at this point. In *Christensen v. Harris County*, Justice Thomas’s majority opinion relied on the meaning of the Fair Labor Standards Act text and on two language canons (*expressio unius* and the Whole Act Rule) to hold that an employer’s restrictive compensatory time policy was lawful under the FLSA. Justice Thomas also considered the contention of petitioner employees and amicus United States that the Court should defer to a Labor Department opinion letter expressly prohibiting what the employer was doing, but he concluded that deference was not warranted. We coded language meaning and language canons as probative elements of the majority’s reasoning, but agency deference as a non-probative reference.

Similarly, in *EEOC v. Waffle House, Inc.*, Justice Stevens’ majority opinion relied on the meaning of the Americans with Disabilities Act text, Supreme Court precedent, and legislative inaction to conclude that a mandatory arbitration agreement prohibiting an employee from seeking judicial remedies did not bar the EEOC from seeking the same victim-specific relief in court. Justice Stevens considered arguments made by the lower court (and by Justice Thomas in dissent) that the purpose of the Federal Arbitration Act and the substantive canon favoring arbitration required a different result, but he found those arguments inapplicable or unpersuasive. We identified language meaning, Supreme Court precedent, and legislative inaction as probative, while coding legislative purpose and substantive canons as merely judicial reasoning and judicial outcomes, we have focused on interpretive resources used to advance the outcome endorsed by the opinion author.

referred.

The coding distinctions we applied to 632 majority opinions also were used to identify the nature and extent of judicial reliance in 377 principal dissenting opinions that included an elaboration of reasons.\textsuperscript{106} For opinions dissenting from a liberal majority, the outcome was, of course, identified as conservative.

D. Caveats Regarding the Dataset

Before proceeding to report on our results, it is worth noting certain limitations of our empirical approach. First, we address only a subset of the Supreme Court’s overall decision docket in recent times. Despite its stability, workplace law disputes constitute just one-sixth of the volume of Court cases. This area of public policy does involve well-defined competing interests, making it relatively easy to code outcomes on an employee versus employer scale. In addition, because Congress’s broad legislative goals in the workplace law area have been essentially unidirectional (\textit{i.e.}, to augment employee protections and thereby improve terms and conditions of employment), it may be easier to analyze whether particular interpretive resources are associated with liberal (or conservative) outcomes than it would be for some other subject matter areas.\textsuperscript{107} Still, it is quite possible that an effort to assess the role of the canons in a

\textsuperscript{105} See id. at 293-96.

\textsuperscript{106} Of the 632 decisions, 252 were unanimous and three involved simply a statement of dissent. We did not code such dissenting statements. For the 377 decisions featuring one or more dissenting opinions, we focus here on the primary or principal dissent. \textit{See note 125 infra} (describing method for identifying that dissent.) We also coded concurring opinions that included an elaboration of reasons, but we do not discuss concurrences in this article. Opinions that both concurred and dissented were identified in that way, but are classified here as dissents and coded only for their dissenting rationales. Sixty-four of these partial dissents combined with 313 “pure” dissents produce the number in text.

\textsuperscript{107} The fact that Congress’s goals have been essentially to promote employee rights and protections in the workplace does not mean they have been exclusively so. Provisions in the Taft-Hartley and Landrum Griffin Acts restricting employee rights to picket and union rights to impede commerce reflect legislative intent that was primarily conservative rather than liberal as we are using those terms. And complex regulatory statutes like ERISA reflect legislative compromises accommodating employer as well as employee interests. Nonetheless, statutes reviewed in

31
different substantive area of Supreme Court case law would tell a different story.\textsuperscript{108}

Next, our dataset covers one discrete period in the long history of the Court. The methodology for interpreting statutes is in part dynamic, insofar as it reflects an ongoing if inchoate conversation between the judiciary and the two more political branches.\textsuperscript{109} The Court’s approach to its interpretive process may therefore by affected over time by external factors such as new appointments and the changing political composition of congressional majorities, and by internal adjustments in the justices’ expectations regarding the legislative performance and capabilities of Congress.\textsuperscript{110} Our period of 34 years allows for observation of some evolution in the Court’s usage of canons, but our discussion of current and relatively recent practices provides for more of an in-depth snapshot than a prolonged historical perspective.

Further, we do not attempt to set priorities among the interpretive resources we identify as probative for each opinion. When a majority author relies on the canons, she may rely on only

---

\textsuperscript{109} See \textit{e.g.}, Adrian Vermeule, \textit{The Cycles of Statutory Interpretation}, 68 U. Chic. L. Rev. 149 (2001) (arguing that interpretive change is due primarily to endogenous shifts in the expectations of legislators and judges, the two key sets of actors in our interpretive system); Ross, supra note 35, at 562 (discussing recurrent interpretive periods characterized by conservative judiciary at odds with a more liberal Congress).

\textsuperscript{110} Textualist judges’ disparaging view of the legislative process as systematically strategic and even manipulative has contributed to reduced reliance on legislative history by the Supreme Court. See Michael H. Koby, \textit{The Supreme Court’s Declining Reliance on Legislative History: The Impact of Justice Scalia’s Critique}, 36 Harv. J. Legal Hist. 384-87 (1999). See also Vermeule, supra note 109, at 160-61 (arguing that members of Congress may respond to this devaluation by making legislative history more accurate, which would encourage future judges to use it more
one other resource or on as many as five, and she may rely on the canons as modestly probative to advance her reasoning in one opinion while invoking them as central to her justification in a separate decision. Judicial reasoning is highly situation-specific, reflecting sensitivity to the novelty and difficulty of issues presented, the nature of divisions among the justices, and at times even the Court’s interest in educating the general public.\footnote{See Mayer G. Freed & Daniel D. Polsby, \textit{Race, Religion, and Public Policy}: \textit{Bob Jones University v. United States}, 1983 \textit{Sup. Ct. Rev.} 1, 20 (1983) (suggesting that Court in \textit{Bob Jones} decision was primarily speaking to newspapers and history books, not rigorously applying legal principles, when it held that racial discrimination violated the “public policy” embedded in the tax code). \textit{See generally} Sisk et. al., \textit{supra} note 95, at 1498-1500; Farber, \textit{supra} note 95, at 1416-30.} We concluded that any effort to rank the Court’s multiple and often complementary justifications for its holdings would require judgments more subjective than we were prepared to make. Accordingly, we focus in our empirical assessment on the presence of expressed reliance, foregoing any attempt to titrate the relative weight of various resources that contribute to each majority opinion. Part IV presents extensive doctrinal analyses, offering a more qualitative assessment of the Court’s reliance on canons in different circumstances.

Finally, our study seeks to examine which interpretive resources were used to justify the Court’s decisions, not what actually accounts for each author’s judicial behavior. As we suggested earlier, it would be difficult if not impossible to assess empirically the array of personal values, practical considerations, and principled reasons that motivates each individual judge.\footnote{See supra at n.44 and accompanying text. Nor do we assess directly the impact of collegial decisionmaking, which may \textit{inter alia} augment or temper the use of canons and other interpretive resources, and may also affect the ideological component of judicial decisionmaking. \textit{See generally} Harry T. Edwards, \textit{The Effects of Collegiality on Judicial Decisionmaking}, 151 \textit{U. Pa. L. Rev.} 1639 (2003). Judge Edwards, who expressly limits his discussion to appellate courts other than the Supreme Court, identifies collegiality as “a \textit{process} that helps to create the conditions for \textit{principled} agreement.” (\textit{id} at 1643, emphasis in original). He regards collegiality as a qualitative filter rather than a quantitative variable, and contends that it mitigates the ideological preferences of judges. \textit{See id} at 1661, 1689.} Our concern with how the Court explains its results is more straightforward but not
therefore less important. The Court’s explanations for its holdings are valuable in part because
they furnish guidelines to lower courts, attorneys, and the legal academy regarding how
justifications should be rendered in future cases. The Court’s principled explanations also are
what legitimates the judicial form of decisionmaking, which in turn contributes to the Court’s
acceptability to a broader public.

In sum, while the limitations of our dataset suggest a need for caution, they also offer
grounds for confidence. Our extensive assessment of one form of judicial reasoning allows for
new insights in both descriptive and normative terms. By focusing on whether the canons are
favored across different time periods, in particular subject areas, or by individual justices, we can
shed considerable light on complex patterns of reliance within the contemporary Court. By
examining possible relationships between reliance on these canons and ideological outcomes, we
can evaluate the theoretical claims regarding ideological neutrality, and predictability or clarity,
that have been vigorously promoted with respect to this interpretive resource.

III. RESULTS

A. Reliance on Canons and Other Interpretive Resources Over Time

We begin with our dataset of 632 workplace law decisions in which the Supreme Court
issued reasoned majority opinions.\textsuperscript{113} Table I reports the extent to which the Court relied on our
ten interpretive resources to justify its holdings. For each resource, we report reliance as a
proportion of the total number of majority decisions over the 34 Supreme Court terms. Table I

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|c|c|c|c|c|c|c|c|}

*indicates t-test reveals a significant difference between Burger Court and Rehnquist Court reliance on same interpretive resource

Preliminarily, Table I provides a useful overview of how the Court has justified its workplace law decisions over this 34 year period. For instance, the Court relied on the inherent or plain meaning of the textual language (including related references to ordinary meaning) in 55.1% of all majority opinions, while relying on dictionary definitions in only 3.5% of its decisions. Further, the Court’s interest in these two resources has become stronger over time. Reliance on the textual meaning resource has increased from 49.1% of all decisions in the Burger Court era to 62.4% during the Rehnquist Court years, while reliance on the dictionary has grown from 1.4% to 6.0% between the two eras. Each of these increases is significant in statistical purposes of our analyses.

114 Although it may seem counterintuitive for judges not to be relying on text as the starting point for their analyses virtually 100% of the time, the 55.1% figure for textual meaning reflects how often we found express reliance on the meaning of the words (not mere reference to textual provisions) to support or advance the actual holding.
Two of our interpretive resources, Supreme Court precedent and legislative purpose, were used as justifications in more than four-fifths of all majority opinions, far exceeding reliance on any other reasoning approach. We believe that the Court’s heavy dependence on its own previous case law is in large part attributable to ordinary or traditional skills of advocacy. Except in rare instances of complete novelty, the parties to a Supreme Court dispute will plausibly contend that some aspect of the Court’s precedents supports their position, even if simply to reframe or subtly modify the general legal rule or standard being applied. In addition, the Court derives part of its legitimacy from wrapping new decisions in a mantle of consistency so as to blend the dual imperatives of stability and change. Invocation of precedent enhances public perceptions of a coherent legal system, and of a judiciary that exercises limited powers, regardless of whether an identified line of prior decisions is dispositive or simply somewhat probative. For these reasons, and perhaps others, it should not be surprising that the Court’s reliance on its own precedent is a staple ingredient of its reasoning.

As for legislative purpose, our rather expansive definition of this category may account for the unusually heavy reliance that we observed. Unlike text, canons, or legislative history, a purposive approach does not require reference to particular provisions or maxims, or to specific

---

115 A t-test compares the mean of two samples or sets of data, controlling for the sample size where that sample size is relatively small (about 25 observations or less) to determine whether the difference could be due to chance (including the possibility of random error in sampling or coding). The z-test operates in the same manner as the t-test, except that the sample size is in excess of 25 observations. For the sake of convenience, we report all significance tests in Tables I through XI as t-tests (t # .05), recognizing that a different distribution (the z-distribution) is being employed for the larger samples. See generally MICHAEL A. MALEC, ESSENTIAL STATISTICS FOR SOCIAL RESEARCH 117-27 (2d ed. 1993). Stata Version 7 assumes the proper distribution (z versus t) based on sample size. See note 89 supra (explaining significance as measured by using t-test.).

116 See generally Barak, supra note 8, at 30-31 (emphasizing the importance of adhering to precedent whenever possible, and making that adherence explicit in order to engender ongoing confidence in a stable and predictable legal order); ROSCOE POUND, INTERPRETATIONS OF LEGAL HISTORY 1 (1923) (describing law’s challenge of
documents in the legislative record. We gleaned the Court’s reliance on legislative purpose from its articulation of justifications grounded in more open-ended terms or concepts, such as the policies or values that a statute was meant to protect,\(^ {117}\) or the goals that Congress must have had in mind,\(^ {118}\) or even the absurd practical consequences that Congress must have wanted to avoid.\(^ {119}\) Although we focused on norms or policies expressly attributed by the justices to Congress or the legislative branch, the often hypothetical or inferential nature of such attributions inevitably broadened the domain of this reasoning approach.\(^ {120}\)

Table I also makes clear that the Court’s pattern of reliance on interpretive resources changed markedly between the Burger and Rehnquist eras. In addition to its increased usage of textual meaning and dictionaries, the Rehnquist Court has shown a greater willingness to justify its decisions through language and substantive canons, as well as common law precedent. The increased value attributed to text, dictionaries, and language canons is consistent with perceptions among scholars and commentators that the Court has become more “textualist” in reconciling need for stability and need for change).

\(^{117}\) See, e.g., Harbor Tug & Barge Co. v. Papai, 520 U.S. 548, 558-60 (1997) (relying on purposes of Jones Act coverage protection for seamen).

\(^{119}\) See, e.g., Albertson’s Inc. v. Kirkingburg, 527 U.S. 555, 577-78 (1999) (reasoning that certain consequences of an ADA interpretation are so absurdly onerous that Congress must have wanted to avoid them); Allis-Chalmers Corp. v. Lueck, 471 U.S. 202, 210-13, 219-20 (1985) (interpreting LMRA so as to avoid practical evisceration of its basic policies).

\(^{120}\) The inferential nature of some purposive attributions has been questioned in methodological terms from inside the Court. See Public Citizen v. Dept. of Justice, 491 U.S. 440, 472-474 (1989) (Kennedy, J., concurring in judgment) (sharply warning against risk that certain judicial predilections or background societal norms will be imputed as “congressional purpose” absent any evidence that Congress considered them). Nonetheless, some interpretive resources are easier to define than others. Legislative inaction and common law precedent also involved more generalized contours, although neither area was invoked nearly as often as legislative purpose. Because the Court regularly justified its conclusions by summoning purposive norms or policy considerations expressly linked to what Congress, or the Act, or the Framers, or the Constitution presumably meant, the legislative purpose category may have become something of a default for reasoning that was too expansive to be assigned to a more precisely defined category. At some future point, we may decide to subdivide this resource category in an effort to sharpen
recent years. Whether one considers such reliance a welcome return to genuinely authoritative resources or a disturbing obedience to linguistic formalism, the trend is both distinctive and ongoing.

Conversely, Table I reveals a diminished appetite on the Rehnquist Court for using legislative history or legislative purpose to explain and justify results. This decreased reliance parallels scholarly commentary discussing the Court’s newfound skepticism as to the value or even coherence of “congressional intent” as a principled explanation for statutory meaning. At the same time, the Rehnquist Court’s increased reliance on substantive canons and common law precedent suggests more willingness to invoke policies or norms that reflect judicial values. That willingness may reflect an emerging interest in resolving close interpretive questions by reference to judicially crafted policy preferences or values, as opposed to policies or norms derived from legislative sources.

Our principal focus is on the canons, and Table II presents in more detail the changes over time in the Justices’ reliance on this interpretive resource. Table II reports both language canon and substantive canon reliance at five year intervals, for majority opinions and also for

our coding approach.

123 Other scholars have remarked on this trend. See Schacter, supra note 95, at 19-30 (observing that during 1996 term, justices regularly invoked wide array of judicially selected policy norms to help them explain or justify their statutory interpretation decisions); Mank, supra note 23, at 614-16 (criticizing Court’s readiness to rely on judicially created canons while undervaluing deference to agency interpretations and evidence of legislative intent).

124 See generally A. Christopher Bryant & Timothy J. Simeone, Remanding to Congress: The Supreme Court’s New “On the Record” Constitutional Review of Federal Statutes, 86 CORNELL L. REV. 328, 332-54 (2000); Ruth Colker & James J. Brudney, Dissing Congress, 100 MICH. L. REV. 80, 87-105. Reliance on the three remaining variables—Supreme Court precedent, agency deference, and legislative inaction—has been relatively consistent between the
primary dissenting opinions.\textsuperscript{125}

\hline
\end{tabular}
\caption{Reliance on Canons Over Time: Majorities (N = 632) and Primary Dissents (N = 377)}
\end{table}

With the exception of a brief period during the mid 1990s, Table II reflects a steady rise in the Justices’ willingness to rely on language canons in majority opinions and a comparable upward trend for dissents as well. The increase in majority reliance began in the mid 1970s and has continued during the Rehnquist Court years, peaking at more than one-third of all majority opinions over the past four terms. Table I indicated that a majority opinion written in the Rehnquist Court era was twice as likely to rely on language canons as one authored in the Burger Court years. The same sharp increase is also evident when comparing the late Burger Court years with the very recent Rehnquist Court. During the 1983-85 terms, majority opinions relied

\textsuperscript{125} Although 40\% of our 632 decisions do not include a dissenting opinion, there are 377 cases that include over 480 opinions dissenting at least in part from the Court’s result. Working with a research assistant, Brudney identified primary dissents in almost all instances based on which dissent garnered the most votes or (in a tie) which dissent was of greatest length. For the five cases in which multiple dissents garnered equal support and were of comparable length, Brudney selected a primary dissent based on his judgment as to which opinion had the most elaborate or complex reasoning.

For our purposes, it was not necessary to report statistical significance in Table II, especially given the small number of observations for many subcategories. Significant difference in reliance on language and substantive canons between the Burger and Rehnquist eras has already been reported in Table I.
on language canons 13.6% of the time, compared with 33.3% of the time in the 2000-02 terms.\textsuperscript{126} As we will see when we examine patterns in the reasoning used by individual justices, the Rehnquist Court’s growing inclination to rely on language canons coincides with the ascendancy of Justices Scalia, Kennedy, and Thomas, who are among the heaviest users of language canons in their majority opinions.\textsuperscript{127} In addition, Justices Brennan, Marshall, and White became substantially more reliant on language canons in majority opinions they authored after 1986.\textsuperscript{128}

With respect to usage of substantive canons in majority opinions, the Court’s reliance also doubled from the Burger years to the Rehnquist era (see Table I), although the trend as reflected in Table II was not as steady. Increased reliance first became apparent in the late 1970s, and it reached nearly one in five majority opinions during the early 1990s, before receding to roughly one-eighth of all majorities over the past seven terms.\textsuperscript{129} As was true with regard to language canons, the Court’s greater willingness to rely on substantive canons is associated with newer arrivals on the Court and also with changes among certain long-tenure justices. Justice Souter and Justice O’Connor have made frequent use of substantive canons in their majority opinions.\textsuperscript{130} In addition, Justices Stevens and White increased their reliance on

\textsuperscript{126} The difference is significant at \( z = .01 \). Data for year-by-year reliance, as well as individual case records coding judicial reasoning for all 632 cases, are on file with the authors.

\textsuperscript{127} By contrast, among justices who served exclusively or almost exclusively on the Burger Court, Justices Powell and Stewart rarely invoked language canons as part of their majority reasoning. \textit{See Table V infra} and accompanying discussion.

\textsuperscript{128} \textit{See id.} With respect to primary dissents that rely on language canons, newer appointees Justices Scalia, Kennedy, and Thomas are again among the heaviest users. In addition, Justices Blackmun and Stevens relied substantially more often on language canons in their primary dissents authored from 1985 onward. Precise figures on primary dissents for individual justices are on file with the authors.

\textsuperscript{129} The pattern for dissents relying on substantive canons is slightly different: the sharp increase in the early 1990s has been basically sustained over the past seven years.

\textsuperscript{130} \textit{See Table VI infra} and accompanying discussion. Justice O’Connor served for five terms on the Burger Court, but she authored only five workplace law majority opinions during that time. By contrast, she has written 42 workplace law majorities since 1986, and those 42 constitute an even larger proportional contribution given the Court’s shrinking docket in this period. Accordingly, for workplace law purposes Justices O’Connor qualifies as
substantive canons in majorities they authored from 1986 onward.\textsuperscript{131}

The Court’s growing reliance on both language canons and substantive canons stands in marked contrast to the declining influence of legislative history as an interpretive justification during this same period. While the overall decrease in reliance on legislative history between Burger and Rehnquist Court majority opinions is reflected in Table I, the decline since the late 1980s has been even more precipitous. In the five terms from 1984-88, the Court’s majority opinions relied on legislative history 42.1% of the time; that figure dropped to 22.6% for the next five terms (1989-93) and has remained between 22 and 25 percent for the past decade.\textsuperscript{132} The arrival of Justices Scalia and Thomas, who have been openly scornful of legislative history as a resource, accounts for a large part of this decline.\textsuperscript{133} In addition, Justices Stevens and White relied considerably less often on legislative history in their majority opinions authored after 1986, and Justice Breyer has invoked that resource on a relatively infrequent basis.\textsuperscript{134} Based on these and other changes, the graph below illustrates how the Court has moved over the past three-plus decades, from initially valuing legislative history far more than the canons to its present position of relying on the canons nearly twice as often as legislative history in its

---

\textsuperscript{131} See Table VI infra.

\textsuperscript{132} The ratios, at 5-year intervals since 1969, are as follows: 1969-73– 43.8%; 1974-78– 45.6%; 1979-83– 48.8%; 1984-88– 42.1%; 1989-93– 22.6%; 1994-98– 22.5%; 1999-2002– 24.4%.

\textsuperscript{133} Justices Scalia and Thomas together have authored 47 majority opinions in the workplace law area, only one of which has relied on legislative history. For examples of the Justices’ critical perspective on legislative history generally, see, e.g., Wisconsin Public Intervenor v. Mortier, 501 U.S. 597, 616-23 (1991) (Scalia, J., concurring); Thunder Basin Coal Co. v. Reich, 510 U.S. 200, 219 (1994) (Scalia and Thomas, JJ., concurring). See also SCALIA, supra note 14, at 29-37.

\textsuperscript{134} Justice Stevens’ reliance has dropped from 48.3% in the Burger years to 25.8% in the Rehnquist era, while he authored virtually the same number of majority opinions in each period (29 in Burger era; 31 in Rehnquist era). Justice White’s reliance declined from 53.1% in the Burger years to 17.6% during his Rehnquist Court tenure, although Justice White wrote far more majorities in the Burger years (49 v. 17). Justice Breyer has relied on legislative history only 21.4% of the time, considerably below the 45.8% of Justice Blackmun, the justice he replaced.
majority opinions.\textsuperscript{135}

\begin{figure}
\centering
\includegraphics[width=\textwidth]{trends_in_reliance.png}
\caption{Trends in Reliance: Canons and Legislative History, Majority Opinions 1969-2003}
\end{figure}

B. Subject Matter and the Canons: Specialization Effects?

Variations in canon usage by the Court may be linked not only to changes in judicial personnel but also to the diverse subject matter composition of workplace law itself. We noted earlier the Court's relatively constant interest in labor and employment issues over the past 30 years.\textsuperscript{136} Yet despite this steady general level of attention, the Court’s specific subject matter priorities have shifted considerably during the course of three decades. From 1969 to the early 1980s, labor-management relations cases and race or sex discrimination cases together comprised over 70\% of the Court’s labor and employment decisions; that proportion had fallen

\textsuperscript{135} The numbers for canon reliance are slightly below the combined totals from columns one and three in Table II, due to the 17 cases (decided over our 34-year period) in which the majority opinion relied on both language and substantive canons.

\textsuperscript{136} See notes 66-68 supra and accompanying text.
to less than 30% by the early 1990s, and has hovered at around 30% for the past decade.\textsuperscript{137} The Court’s more disparate diet of workplace law cases doubtless can be attributed to a range of legal and policy developments, notably including a proliferation of new federal employee protection laws since the late 1960s and substantial changes in the demographics and structure of the labor market over that same period.\textsuperscript{138}

In recognition of the broad range of workplace-related subjects that now give rise to interpretive disputes, Tables III and IV present the Court’s patterns of reliance on the canons across these distinct substantive law areas. Table III reports language canon reliance for our eight identified subject matter categories, calculated basically as a proportion of the total number of majority decisions in each category.\textsuperscript{139} Table III further breaks down this language canon reliance into Burger Court and Rehnquist Court periods.

Certain subject matter categories are associated with unusually high Court reliance on language canons. In particular, majority opinions interpreting minimum standards laws, ERISA

\textsuperscript{137} See Brudney, supra note 66, at 153-59 (documenting this shift in detail through 1999 Term). In the past three terms (2000-02), the Court has decided 42 workplace law cases: 12 of these (28.6\%) have involved either labor-management relations or race or sex discrimination, while the rest (71.4\%) have addressed the assorted other workplace law categories identified supra at notes 71-76 and accompanying text.

\textsuperscript{138} Congress’s newer enactments have been mostly in the areas of minimum standards, retirement and other fringe benefits, and age and disability discrimination. This increased reliance on government regulation as a preferred means of structuring the employment relationship has presented the Court with many new interpretive issues. Moreover, the new issues have generally arisen in the context of a gradually aging workforce, an expansion of contingent employment arrangements, and the periodic tremors of corporate downsizing. Each of these factors has contributed to real and perceived threats affecting job security, retirement eligibility, and health benefits among American workers. In addition, the sharp decline in union density and the resolution of major interpretive battles over the meaning of Title VII have diminished the urgency of litigation in the two areas that formerly commanded most of the Court’s attention. See Brudney, supra note 66, at 158.

\textsuperscript{139} As discussed supra at note 76, there are 68 decisions in which the Court resolved issues in two or more distinct areas of federal workplace law that cut across our subject matter categories (e.g., a case involving both NLRA and ERISA interpretation, or a case involving FLSA and Tenth Amendment interpretation). One of these cases involved the resolution of issues in three areas, while the other 67 involved two subject matter categories. In an effort to reflect more accurately the interpretive resources relied on by the Court in these cases, we assigned each resource separately to whichever statutory or constitutional category was implicated by reliance on that resource. The result is an 11\% increase in our universe of “decisions” (N=701) for Tables III and IV, but we believe this is acceptable in order to assure that judicial reasoning relied on to resolve a Tenth Amendment issue is not imputed to the FLSA
and other retirement legislation, and miscellaneous statutes, made significantly more use of language canons to help justify their results when compared with the baseline rate of reliance.140

*indicates t-test reveals significant difference in reliance for All Years between each issue area and all other issue areas
# indicates t-test reveals significant difference in reliance for a given issue area between Burger Court and Rehnquist Court

As Table III indicates, the Court’s minimum standards decisions invoked language canons 31.4% of the time, compared to 15.4% for all workplace law decisions. Moreover, the noticeably higher level of reliance was evident in both Burger and Rehnquist Court years, and this heavier reliance also persisted through both periods for the retirement and miscellaneous categories.

By contrast, the Court’s reliance on language canons in labor relations decisions and in race or sex discrimination decisions hovered around the baseline rate for all cases, although reliance in these two areas increased significantly between the Burger and Rehnquist eras. The Court’s complete non-reliance on language canons in constitutional cases presumably reflects the category (or vice versa).

140 Significance results reported with an asterisk are for the All Years category, based on comparing canon usage in each issue area to the baseline of all cases minus that issue area. Significance results identified as “#” report changes in language canon usage for a particular issue area as between the Burger and Rehnquist eras.
justices’ greater willingness to invoke policy related justifications when interpreting the Constitution, as well as the comparatively straightforward linguistic structure of provisions such as the First, Fifth, and Fourteenth Amendments.\(^{141}\)

Although we discuss the applicability of various theories in case-specific terms in Part IV, these subject matter results are intriguing from a public choice perspective. The Court’s heavy reliance on language canons in the area of retirement legislation is consistent with the theory that such canons may serve in part as substitutes for more policy-oriented justifications. Controversies arising under ERISA and related federal retirement provisions present difficult and at times highly technical interpretive questions, and the justices are less likely to approach such questions with the expertise or even the comfort level they may bring to more intellectually or ideologically accessible areas such as race discrimination or labor-management relations.\(^{142}\)

Within the minimum standards category, the justices have relied heavily on language canons when construing safety and health legislation—either provisions that regulate technical safety and health standards\(^ {143}\) or disputes involving complex procedural or jurisdictional questions.\(^ {144}\) The Court also has frequently invoked these canons when construing the rather low-
visibility statute that provides specialized protection for longshoremen and harbor workers.\textsuperscript{145} Although the number of cases in each of these minimum standards subcategories is relatively small, this trend toward greater language canon usage in more technical or specialized statutes is broadly consistent with what we observed in the retirement category.

Also of interest is the Court’s reliance on language canons in 21 of the 108 majority opinions that interpret the provisions of Title VII.\textsuperscript{146} Unlike statutes such as the Coal Mine Safety Act or the LHWCA, Title VII disputes appear to present more obviously policy related controversies. From a public choice standpoint, it would seem plausible that as a general matter the justices relied less often on ostensibly content-neutral linguistic techniques to help justify their results in such cases. In this regard, it is notable that for 17 of the 21 majority opinions that did use language canons, the controversy before the Court could fairly be called procedural rather than substantive, and more technical than ideological. The Title VII decisions that relied on language canons mainly involved disputes over ancillary and specialized aspects of monetary relief,\textsuperscript{147} contests regarding limitation periods and retroactivity,\textsuperscript{148} and controversies focused on

---

\textsuperscript{146} Title VII cases follow the Court’s general trend regarding reliance on language canons in the race and sex discrimination issue area. The overall 20.4\% ratio for Title VII majority opinions combines 13.4\% of the 67 Burger Court Title VII majorities with 31.7\% of the 41 Rehnquist Court majorities.

jurisdictional questions or other procedural matters. Thus, even with respect to perhaps the most ideological statute in the workplace law arena, the Court’s use of language canons is associated with more technical and less ideological aspects of the statutory scheme.

Turning to substantive canons, Table IV reports reliance for the eight subject matter categories, again further subdivided based on the Burger Court and Rehnquist Court eras. In the retirement category, the Court’s decisions rely more frequently on substantive canons, just as they more often made use of language canons in that area. The Court’s reliance on substantive canons in race or sex discrimination decisions is right around its baseline rate of reliance for all cases; this too is similar to the Court’s pattern with respect to language canons.

---

149 See, e.g., Liberty Mutual Ins. Co. v. Wetzel, 424 U.S. 737 (1976) (resolving whether district court order was an appealable final decision); Yellow Freight Sys. v. Donnelly, 494 U.S. 820 (1990) (addressing state court jurisdiction over Title VII claims).

151 There are Title VII cases in which reliance on language canons is part of a majority opinion resolving a more obviously substantive and policy-related dispute. See, e.g., Morton v. Mancari, 417 U.S. 535 (1974) (reconciling Title VII anti-discrimination standards with preference for Native Americans in Indian Reorganization Act); Hishon v. King & Spaulding, 462 U.S. 69 (1984) (holding that business partnership decisions are covered by Title VII); Harris v. Forklift Sys., 510 U.S. 17 (1993) (refining liability standard for hostile environment sexual harassment claims).

152 The rate of reliance on substantive canons for labor relations decisions is significantly lower than for the baseline of all other decisions. As in Table III, significance results are reported in two contexts: comparing canon usage in each issue area to the baseline of all cases minus that issue area, and comparing canon usage in a particular issue area as between the Burger and Rehnquist eras. See note 140 supra. For explanation of why “N” is 701 rather than 632 for Table IV, see n.139 supra.

*indicates t-test reveals significant difference in reliance for All Years between each issue area and all other issue areas
#indicates t-test reveals significant difference in reliance for a given issue area between Burger Court and Rehnquist Court

On the other hand, the Court uses substantive canons less often in its minimum standards decisions, an area in which the Court has relied heavily on language canons. Further, the Court’s more regular usage of substantive canons in the constitutional category represents a striking contrast with its practice of total nonreliance on language canons in that subject matter area. Given that substantive canons often embrace policy preferences—including preferences linked to perceived constitutional norms or values—it is not surprising that the Court finds them more useful than language canons when resolving constitutional controversies.

More generally, the fact that substantive canons tend not to be viewed as content-neutral may make them less attractive to the justices as detached substitutes for ideological value choices. Instead, insofar as these substantive canons express judicial policy preferences, the ways in which they are used over a period of time may be linked more to the policy implications of individual canons than to the statutory subject matter category in which they arise. For example, one might expect that canons reflecting a particular policy position, such as respect for
federalism and states’ sovereignty, might be invoked more often during periods when that policy position is shared by a majority of the justices. Conversely, for canons that are less explicitly policy-oriented but instead may relate more to structural or legislative process norms, such as avoiding constitutional issues or disfavoring repeals by implication, one might surmise that the patterns of reliance would be relatively steady or continuous.

Our results on the most frequently invoked substantive canons tend to support this expectation. The Court has relied in 11 majority opinions on some version of what we call an anti-preemption canon, presuming that absent explicit statutory language, federal law should be understood not to interfere with traditional or core state functions. Ten of those 11 opinions have been handed down since 1984, which corresponds generally to the time when the Court has staked out a distinctive position supportive of states’ rights and suspicious in constitutional terms of federal regulatory encroachment. A related though distinct federalism canon requires unmistakably clear federal statutory language in order to abrogate the states’ Eleventh Amendment immunity from lawsuits in federal courts. Seven of the eight majority opinions relying on this canon were issued from 1985 onward.

---

153 There is considerable controversy over whether the avoidance canon is ideological, or predictably hostile to congressional intent. See Ernest A. Young, Constitutional Avoidance, Resistance Norms, & the Preservation of Judicial Review, 78 Tex. L. Rev. 1549, 1573-1601 (2000). We report on empirical results with respect to the ideological direction for this canon at note 195 and accompanying text, infra.

154 The ten were decided in 1984, 1985, 1988, 1989 (2), 1995, 1997 (3) and 2002. The eleventh was decided in 1979.

The pattern of reliance is more continuous, however, with respect to substantive canons that are not as ideologically oriented. Thus, the Court on 12 occasions has relied on the canon of construing a statute restrictively in order to avoid possible or likely constitutional problems: seven of those decisions were handed down in the Burger era while five were issued during the Rehnquist years. Likewise, the Court in seven instances has relied on the presumption disfavoring implied repeals by Congress: three during the Burger years and four in the Rehnquist era.

C. The Justices and the Canons: Individual Variations in Usage

In addition to reviewing the Court’s reliance on canons over time and by subject matter category, we also examined how individual justices made use of canons in their majority opinions. Authoring an opinion for the Court is hardly an exercise in free will. Majority opinions typically are assigned by the Chief Justice based on criteria that go well beyond the assignee’s desire to take on the task. In addition, the contours of the opinion will likely be shaped to some extent by the litigants’ contentions in their briefs and at oral argument, and by the rationales the justices discuss at conference. Still, the justices do retain discretion as to

---

158 The three Burger Court decisions came down in 1974, 1981, and 1982; the four Rehnquist Court cases were decided in 1987, 1987 (again), 1991, and 2003.
159 Assignments (including self-assignments) may be used to further the policy goals of the Chief Justice or the senior associate justice making the assignment. The assignment power also is used to meet the Court’s institutional needs, such as equalizing workload, enhancing efficiency through issue specialization among the justices, or solidifying a majority coalition in a closely divided case. See generally SEGAL & SPAETH, supra note 85, at 261-75; Forrest Maltzman & Paul J. Wahlbeck, May it Please the Chief? Opinion Assignments in the Rehnquist Court, 40 AM. J. POL. SCI. 421 (1996).
160 See HENRY J. ABRAHAM, THE JUDICIAL PROCESS 207 (4th ed. 1980) (quoting Justice Powell’s observation that his initial views on an argued case were “not infrequently” altered through discussion at Conference); BOB WOODWARD & SCOTT ARMSTRONG, THE BRETHREN 308-10 (1979) (describing fluid dynamic during Conference on a controversial case).
how they will present justifications for the results reached, so long as they can hold onto at least four other votes. Thus, it is not surprising that we found considerable variation in the justices’ individual willingness to rely on either language or substantive canons.\textsuperscript{161}

Table V reports individual justices’ reliance on language canons in their majority opinions, listing each justice’s total number of majority opinions as well.\textsuperscript{162} We have arranged the 19 justices who served between 1969 and 2003 based on frequency of their language canons usage, starting with high users. For justices whose tenure spans both the Burger and Rehnquist Courts, we also report reliance separately for each period.

</table>

\textsuperscript{161} It seems reasonable to believe that the parameters set by briefs, oral argument, and conference discussion are equally constraining, or tractable, for each justice who author a majority opinion. Opinion assignments, by contrast, are concentrated in fewer hands: in our 34-year period this was primarily the two Chief Justices, and presumably also Justices Brennan and Stevens as recurrent senior members of majorities that did not include the Chief Justice. Still, choice among reasoning approaches would not seem to be a determining or even influential factor when exercising this assignment power. As indicated in Table V, one of the Chief Justices was a high user of language canons while the other has been a relatively low user.

\textsuperscript{162} Because the Court issued 22 \textit{per curiam} opinions, the total number of majority opinions authored by named justices is 610.
Among justices who have authored 20 or more workplace law majority opinions, the four most frequent users are two conservatives, Justices Thomas and Scalia, and two liberals, Justices Stevens and Blackmun. At first glance, this allocation might seem to indicate that language canons are comparably valued by justices of distinct ideological perspectives. In looking at these four justices’ reliance on other interpretive resources in their language canon decisions, however, a more complicated picture emerges. Justices Thomas and Scalia each have authored nine majority opinions that rely on language canons. Of those 18 opinions, not one relies on legislative history, and only six rely on legislative purpose, a proportion that is far below legislative purpose reliance for all decisions during the Rehnquist Court years. By contrast, of the 32 majority opinions authored by Justices Stevens and Blackmun that rely on language canons, 19 also rely on legislative history while 25 rely on legislative purpose.

These are striking disparities in how the four justices have used language canons in relation to interpretive resources that are traditionally associated with specific congressional intent or legislative policy preferences. Such disparities likely reflect serious disagreement as to

---

163 Each of these justices relied on language canons significantly more often than the baseline of all majority opinions minus those authored by that justice. Other justices with relatively high rates of reliance (Burger, Breyer, Ginsburg) have authored fewer majorities; their reliance did not differ significantly from the baseline. By contrast, Justice White was significantly less likely than his colleagues to rely on language canons in his majority opinions.

164 Justice Thomas’s nine majority opinions include four that make use of legislative purpose in some way; Justice Scalia’s nine majority opinions include two such decisions.

165 Justice Stevens authored 18 majority opinions making use of language canons; he relied on legislative history in 11 of them, and in legislative purpose in 13. Of Justice Blackmun’s 14 majority opinions relying on language canons, 8 relied on legislative history and 12 on legislative purpose.
the appropriate hierarchy of legitimate justifications for judicial decisions interpreting a statutory
scheme or provision. For Justices Scalia and Thomas, the statutory text is not only the most
authoritative source of meaning, it should be the exclusive source whenever possible.166
Accordingly, language canons are a primary resource, used to extend and deepen textual
analysis, as part of a nuanced linguistic approach that may also rely on dictionaries167 and on the
Court’s own precedents construing identical or comparable language provisions.

Justices Stevens and Blackmun take a more traditional legal process-oriented approach to
the interpretation of statutes. In searching for and relying upon evidence of what Congress
specifically had in mind, or what it must have meant from a policy standpoint, these justices do
not view the text and accompanying linguistic tools of textual elaboration as the final word.
Legislative history and purpose will often be used to confirm what the text seems to mean,168 and
on occasion will be relied upon to supersede that apparent meaning,169 but under either approach
these contextual resources play a positive role in justifying results reached by the Court. In this
setting, language canons are more supplemental than primary, serving as part of a broader web of
resources that allows the Court to derive interpretive value from historical and practical context

167 The 18 majority opinions by Justices Scalia and Thomas relied twice (11.1%) on dictionaries, well above the
norm of 3.5%. Justices Thomas and Scalia generally rely on dictionaries much more than the Rehnquist Court
norm—7 of 32 total majority reliances since the 1993 Term (Thomas 2 of 18; Scalia 5 of 14) constitutes together
22%, compared to 7.8% (8 of 103 majorities) for all other justices during the same time period.

168 See, e.g., Bd. of Educ. v. Harris, 444 U.S. 130, 143-46 (1979) (Blackmun majority opinion relying on legislative
history as confirming textual analysis); Thunder Basin Coal Co. v. Reich, 510 U.S. 200, 209-13 (1994) (same);
Mohasco Corp. v. Silver, 447 U.S. 807, 818-22 (1980) (Stevens majority opinion relying on legislative history to
support that text means what it says); Massachusetts v. Morash, 490 U.S. 107, 115 (1989) (Stevens majority opinion
relying on congressional purpose to reinforce and strengthen textual analysis).

as well as literal text.\textsuperscript{170}

To illustrate this basic distinction in types of reliance, an Appendix summarizes four majority opinions, one authored by each of the aforementioned justices.\textsuperscript{171} These four examples are not meant to suggest that language canons are always relied upon in one way by textualists such as Justices Thomas or Scalia and in a different way by legal process advocates like Justices Stevens or Blackmun. They are, however, indicative of a basic dichotomy in terms of how language canons are integrated with certain other interpretive resources.

Apart from our comparisons among the most frequent users, Table V also reveals interesting variations in language canon reliance among the six justices who made substantial contributions to workplace law during both the Burger and Rehnquist Court periods.\textsuperscript{172} Three of these justices—Justices Stevens, Blackmun, and Rehnquist—remained relatively constant in their use of language canons between the two eras.\textsuperscript{173} The other three, however—Justices Brennan, Marshall, and White—made much heavier use of language canons in their Rehnquist era majority opinions than they had during the Burger years.\textsuperscript{174} These increases occurred during

\begin{footnotesize}
\begin{enumerate}
\item[170] It is worth noting that Justices Scalia and Thomas rely on fewer interpretive resources to explain or justify their results. The 18 Scalia and Thomas majorities average 2.4 resources per opinion (Thomas 2.22; Scalia 2.67), while the 32 Stevens and Blackmun majorities average 3.6 resources per opinion (Stevens 3.6; Blackmun 3.6). Thus, the substantially greater Stevens-Blackmun reliance on legislative history and purpose does not appear to be a substitute for some other resources.
\item[171] We do not maintain that these opinions are “representative” of each justice’s overall output in any mathematical sense. Still, we believe they help illuminate why aggregate differences exist.
\item[172] Our measure of substantiality is solely quantitative, based on authoring at least 15 majority opinions in each period. Justice O’Connor authored only five majorities in the Burger years, and Justice Powell wrote only three majorities in the Rehnquist era; accordingly, they are not included in this discussion.
\item[173] Justice Stevens used language canons in 31.0\% of his Burger Court majorities and 29.0\% of Rehnquist Court majorities; for Justice Blackmun, the corresponding proportions are 32.1\% (Burger) and 25.0\% (Rehnquist) while for Justice Rehnquist they are 12.5\% (Burger) and 13.3\% (Rehnquist).
\item[174] The increase was most dramatic for Justice Brennan, whose rate of reliance rose from 5.6\% (Burger) to 40\% (Rehnquist). Justice Marshall went from 5.4\% to 25\%, while Justice White moved from 4.1\% to 11.8\%. The increases between eras were significant, using the t-test, for Justices Brennan (t = .01) and Marshall (t = .03), while the increase for Justice White was not significant (t = .12).
\end{enumerate}
\end{footnotesize}
the same period when the Court’s workplace law docket was becoming notably more diverse and less dependent on labor relations and race or sex discrimination cases, and it is plausible to believe that subject matter shifts contributed to the three justices’ greater propensity to invoke language canons.

Yet, the cumulative impact of a five-fold increase in reliance for three justices who had been among the lowest users of language canons suggests that other factors were at work as well. One possibility is that the new arrivals exerted a subtle but important influence on the Court’s methodological culture. By relying more often, and more prominently, on language canons as part of their linguistic approach to judicial reasoning, Justices Scalia and Kennedy elevated the status and role of this assertedly content-neutral resource. Justices Brennan, Marshall, and White may therefore have come to regard analysis using language canons as more important, and—perhaps subconsciously—as an approach that would be valuable in order to attract or retain the allegiance of their newer colleagues.

With respect to substantive canons, Table VI reports individual justices’ reliance, again arranging the 19 justices starting with those who most often make use of substantive canons in

---

175 Taking Justices Brennan, Marshall, and White together, language canon reliance in their majority opinions soared from 5.0% (7 of 140 majority opinions authored from 1969 to 1986) to 25.0% (12 of 48 majorities authored from 1987 to 1992).

177 Because Justices Stevens and Blackmun had regularly relied on language canons in their Burger Court majorities, the arrival of others who favored their use would presumably not have had the same effect. The combined effect of these two holdovers plus the arrival of Justices Scalia and Kennedy may, however, have helped sharpen Brennan, Marshall, and White’s awareness of their increasingly anomalous status on this score. Justice Thomas may also have contributed to Justice White’s increased willingness to use language canons, but he could not have affected Justices Brennan or Marshall as he arrived after their departure.
their majority opinions. The eight justices who served on both the Burger and Rehnquist Court have their rates of reliance identified separately for each era.

*indicates t-test reveals a significant difference between each Justice’s reliance and reliance in decisions authored by all other Justices

Focusing on the justices who have authored 20 or more majority opinions, we see that two relatively frequent users of substantive canons—Justices Stevens and Blackmun—also had relied heavily on language canons. The heaviest users of substantive canons in this group, Apart from pure (or even strategic) collegiality considerations, regard for principles of argumentation also may have been at work. Because more justices were resorting more often to language canon arguments, Brennan, Marshall and White may have felt increasingly obligated to answer them in like terms.
Justices Souter and O’Connor,\textsuperscript{178} were slightly below the Court average in their reliance on language canons. Moreover, the two most regular users of language canons, Justices Scalia and Thomas, rank much lower in their willingness to make use of substantive canons. For Justice Scalia, the contrast is especially stark: of his 27 majority opinions, nine rely on language canons as part of their reasoning while not a single one makes use of substantive canons. This difference is consistent with Justice Scalia’s stated philosophy of interpretation set forth in his Tanner Lectures, where he extolled the common sense and content-neutral virtues of the language canons while doubting the legitimacy of more substantive “dice-loading rules.”\textsuperscript{179}

As was true for language canons, the sharp increase in use of substantive canons between the Burger and Rehnquist eras coincides both with certain newer arrivals at the Court and with changed patterns of reliance among some “longer term” justices. Justices Souter and O’Connor, newer members of the Court, use substantive canons considerably more often than Justices Powell and Stewart did during the Burger Court years. In addition, Justices Stevens and White relied on substantive canons more frequently after 1986 than they had as Burger Court members.\textsuperscript{180} This latter increase may relate in part to a different kind of change in the Court’s methodological culture, stemming from heightened interest in federalism issues\textsuperscript{181}.

\textsuperscript{178} These two justices are the only ones whose reliance on substantive canons is significantly above the reliance by justices in all other opinions.

\textsuperscript{179} \textsc{Scalia, supra} note 14, at 28. \textit{See generally} note 39 \textit{supra} and accompanying text. Justice Scalia, however, does regularly join majority opinions that rely on the substantive canons, and he has not distanced himself from such reasoning in separate concurrences as he has often done with respect to legislative history reliance by the majority. \textit{See} note 166, \textit{supra}.

\textsuperscript{180} Justice Stevens’ increased usage between the two eras was significant (t = .01) as was Justice White’s (t = .048).

D. The Canons and the Size of the Court Majority

A further dimension to our description of canons usage involves the possibility that patterns of reliance may differ in close cases as opposed to unanimous decisions or those that are nearly unanimous (such as 8-1 or 7-2 votes). For this purpose, we have grouped the data set in four categories, depending on whether the Court’s decision (i) was unanimous (involving zero dissenters); (ii) enjoyed a wide margin of support (a vote differential of five, six or seven); (iii) was supported by a moderate sized majority (a vote margin of three or four); or (iv) was a close case (a vote margin of one or two).\textsuperscript{182} Table VII reports the frequency of language canon usage for each of these four categories. We measure reliance as a proportion of the total number of majority opinions in each of our four vote differential categories and in each of our two Court eras. Thus, for instance, the Burger Court relied on language canons in 18.6\% of its 118 unanimous majority opinions while the Rehnquist Court did so in 21.6\% of its 134 unanimous majorities.

As presented in Table VII, there are intriguing differences evident over time in the amount of intra-Court controversy attached to majority opinions that invoke language canons. The Burger Court relied on language canons in its unanimous majority opinions more than twice as often as it used them in closely contested cases. The fact that language canon usage is more likely to be associated with broad consensus among the justices is consistent with a view of these canons as content-neutral justifications that may well facilitate agreement across traditional ideological lines.\textsuperscript{183}

\textsuperscript{182} We counted concurring opinions on the side of the majority, while an opinion or vote that both concurred and dissented was counted as a dissent.

\textsuperscript{183} See generally Macey & Miller, supra note 13, at 658; Frederick Schauer, Statutory Construction and the Coordinating Function of Plain Meaning, 1990 SUP. CT. REV. 231, 247-49 (1991). The Burger Court’s increased
By contrast, the Rehnquist Court has relied on language canons in close cases somewhat more often than it has in unanimous decisions, although the difference is not significant. Further, the Rehnquist Court has been significantly more likely than the Burger Court to use language canons in support of narrow majorities. This very different Rehnquist Court profile, in which so many closely contested decisions include language canon reliance, suggests a possible link between these canons and recent policy-related divisions within the Court. We return to this association in Part III E.

For similar size-of-majority data regarding the substantive canons, we turn to Table VIII. Once again, reliance is assessed as a proportion of the total number of majority opinions in the four vote differential categories, broken down into Burger and Rehnquist Court eras.

---

184 For the Rehnquist Court’s increased tendency to rely on language canons in close cases as contrasted with unanimous opinions, \( z = .15 \).

*indicates t-test reveals a significant difference in reliance between Burger Court and Rehnquist Court for a given majority vote margin.

Here, the contrast between Burger and Rehnquist periods is not as great. During both eras, substantive canons were used more in close cases than in unanimous decisions. Indeed, they were used in close cases more than in any of the three other categories. Given that these substantive canons do represent judicial policy preferences, often related to politically divisive issues such as federalism or separation of powers, it is not terribly surprising that reliance on them is associated with more divisive voting patterns among the justices. Still, it is noteworthy that the Rehnquist Court justices remain significantly more likely than their Burger Court counterparts to rely on substantive canons when justifying results in the closest cases.

E. The Canons and Ideology

In attempting to assess whether canon usage during our 34 year period points distinctively in a liberal or conservative direction, we adopt a number of different perspectives. We ask first if reliance on the canons is predictably related to a particular kind of ideological result in majority opinions taken as a whole. We then look separately at distinct groups of conservative and liberal justices, to assess how each group uses canons in relation to its respective policy preferences. Next, we focus on the subset of 148 closely contested decisions, considering the extent to which reliance on the canons in this more controversial setting has
ideological associations. Finally, we examine the ideological tenor of a special group of cases in which majority reliance on canons clashes with dissent dependence on legislative history or on competing canons.

Each of these approaches is by definition incomplete. Even taken together, they cannot be fully responsive on the relationship between canon usage and ideological outcome. For a start, it is not self-evident how one should define “ideologically neutral” in this context. We adopt as our presumptive definition that an interpretive resource is neutral if its use by the Court is as likely to be associated with a liberal result as with a conservative one. We attempt to control for the influence of other factors by supplementing our bivariate analyses through the use of regression equations.\(^\text{185}\) At the same time, we are unable to control for certain influences that may help determine which justice will write a majority opinion, and whether others will have input. These elements include, at a minimum (i) the prospect (especially in unanimous or near-unanimous decisions) that opinion assignments may serve workload equalization goals rather than reflect an assigned writer’s ideological perspective; (ii) the extent to which (especially in closer decisions) opinion assignments and substantive reasoning may promote strategic

\(^{185}\) The use of a multinomial logistic regression model allows multiple categories of the dependent variable to be analyzed and compared against a base category, and—as a result of being included in the same analysis—also against each other. The primary analysis uses as its four-part dependent variable whether a majority opinion expressly relied on no canons at all, language canons alone, substantive canons alone, or both types of canons, in justifying its result. The model includes as independent variables—in addition to the liberal or conservative nature of the outcome and of the opinion author—a large number of background factors addressed to the subject matter of the case, the vote margin enjoyed by the majority, the types of interpretive resources (other than canons) relied on in the Court’s reasoning, and the presence or absence of selected interpretive resources in the dissent’s reasoning.

If logistic regression had been used instead of multinomial logit, the analyses would be insufficient to gauge the import of the canons because (for instance) a model focused on language canons would be comparing language canon usage against all other categories, not just against no canon usage. Multinomial logistic regression analysis more accurately reflects the reality of the potential canon usage employed by the justices, through proper comparisons. See generally TIM FUTING LIAO, INTERPRETING PROBABILITY MODELS 48-51 (1994). We report our basic multinomial regression results in Table XII infra. We also ran additional regression equations to address supplemental questions; results are summarized in notes 190, 191, 200, 213, 220 and accompanying text. Copies of these additional regression results are available from the authors upon request.
considerations such as retaining a fragile majority coalition;\textsuperscript{186} (iii) the impact of collegial exchanges, at oral argument and in private settings, on the justice assigned to write the opinion;\textsuperscript{187} and (iv) the unarticulated and even subconscious differences in intensity of policy preference brought to the table by each potential majority author.

Still, our multi-faceted exploration does help to illuminate the diverse connections between canon usage and ideological outcomes. Importantly, our approach also reaffirms the basic nature of the relationship between judicial reasoning and decisional outcome as situational and evolving rather than uniform and static. Through examining a series of large and small case groupings, we can observe the circumstances under which the justices appear to rely on the canons as neutral interpretive resources at the broadest level, but as instruments functioning to support or even strengthen certain ideological leanings as we focus on more controversial, closely divided settings.

1. Ideology and the Data Set as a Whole

Initially, we have grouped the data set in three categories, based on whether the outcome was liberal (pro-employee or pro-union), conservative (pro-employer), or, in a small number of cases, indeterminate.\textsuperscript{188} Table IX reports the frequency of language canon and substantive canon

\textsuperscript{186} There are many examples of an opinion with a liberal outcome being written by the most conservative member of the majority coalition (or conservative opinions written by the most liberal member of the coalition) to ensure the majority holds firm or that it is narrowly confined. \textit{See, e.g.,} Grutter v. Bollinger, 123 S.Ct. 2325 (2003) (O’Connor, J., majority opinion). \textit{See generally} \textsc{Henry J. Abraham, The Judiciary: The Supreme Court in the Governmental Process} 37 (10th ed. 1994). \textit{See also} Linda Greenhouse, \textit{Steady Rationale at Court Despite Apparent Bend}, \textit{N.Y. Times}, May 28, 2003 at A-22 (suggesting that Chief Justice, who retained assignment in important Eleventh Amendment decision, had used his majority opinion to continue Court’s institutional control of linetfall in this area).

\textsuperscript{187} \textit{See generally} Edwards, \textit{supra} note 112, at 1661-62 (arguing that variable-based empirical analysis of judicial decisionmaking fails to capture the process of dialogue, persuasion, and revision that characterizes appellate deliberations).

\textsuperscript{188} \textit{See} notes 78-82 \textit{supra} and accompanying text for a detailed explanation of how we coded judicial outcomes, including indeterminate results.
usage for the 584 cases with an identified ideological result and also the 48 indeterminate decisions. While decisions relying in part on substantive canons appear to be slightly more conservative than the conservative proportion of all decisions, and decisions invoking language canons seem marginally more liberal than the percentage of all decisions, neither difference is close to significant.

We also used a multinomial logistic regression model to probe further into the possibility that the Court’s overall reliance on either language canons or substantive canons might be associated with a particular ideological direction. We analyzed whether reliance on either language or substantive canons was significantly associated with a liberal or conservative result when controlling for the subject matter being decided, the size of the Court’s majority, and the use of other interpretive resources. The independent variable addressing decisional outcome was never close to significant. In an effort to determine whether the Court’s reliance on canons might have become more ideological over time, we applied the same multinomial regression model to the two subsets of all 350 Burger era decisions and all 282 Rehnquist era

---

189 See n.185, supra, discussing our approach to multinomial logit regressions.

190 We also constructed a separate logistic regression equation in which decisional outcome was the dependent variable and language canon usage, substantive canon usage, and both canons’ usage were included as independent variables. None of these canon options was close to significant. Indeed, only one interpretive resource independent variable showed significant or close to significant results with decisional outcome as a dependent variable. Majority
cases. There was no significant relationship between decisional outcome and majority reliance on language canons or substantive canons in either era.\textsuperscript{191}

With respect to substantive canons, it is worth noting that overall neutrality may reflect at least in part the “balancing” impact associated with the Court’s use of several types of substantive canons in this area of law. When the Court invokes its “superstrong clear statement rule,” requiring the clearest possible evidence that Congress meant to abrogate the Eleventh Amendment immunity of the states, the result has almost always been a victory for the state as employer.\textsuperscript{192} In addition, two other canons less often invoked—the presumption against interpreting statutes to apply retroactively and the presumption against waivers of sovereign immunity by the Federal government—have been associated with consistently pro-employer outcomes.\textsuperscript{193} By contrast, the canon that Congress is presumed to follow common law usage, and the canon presuming against federal preemption of historic or traditional state functions, have regularly been associated with pro-employee outcomes in this 34-year period.\textsuperscript{194} Finally, the constitutional avoidance canon has been relied on virtually as often in liberal as in

\begin{footnotesize}
\begin{itemize}
  \item opinions relying on common law precedent were significantly associated with conservative results (p = .04). Copies of these regression results are on file with the authors.
  \item Copies of these two regression results are on file with authors.
  \item There have been eight such cases (six in the Rehnquist era), and seven have yielded conservative, pro-employer outcomes. The one exception was \textit{Port Authority Trans-Hudson Corp v. Feeney}, 495 U.S. 299 (1990).
  \item There have been three decisions relying on the anti-retroactivity presumption and five decisions invoking the presumption against waivers of sovereign immunity: all eight reached conservative outcomes.
  \item Of the six majority opinions relying on the “Congress follows common law usage” presumption, four reached liberal results, one was conservative, and one indeterminate. Of the 11 majority opinions relying on what we refer to as the anti-preemption canon (see text accompanying notes 154-155 supra), seven reached liberal results, three resulted in conservative outcomes, and one was indeterminate. The latter findings appear to reflect changes in the tenor of applicable state statutes and common law. In the 1950s and 1960s, NLRA preemption cases often involved state law that imposed restraints on union activities, making states’ authority less supportive of what were deemed employee interests than was the federal statute that arguably preempted them. \textit{See, e.g.}, San Diego Bldg. Trades Council v. Garmon, 359 U.S. 236 (1959). By the 1980s, state statutory and common law developments offered increased rights and protections to employees, and the “anti-preemption” position became more favorable to
\end{itemize}
\end{footnotesize}
conservative decisions—both during the Rehnquist years and in the Burger era.\textsuperscript{195}

2. **Ideology and Canon Reliance by Conservative and Liberal Justices**

Although the use of the canons by the Court as a collective entity has been ideologically neutral, there remains the possibility that canon reliance is ideologically linked in the hands of certain conservative or liberal justices. To consider this possibility, we focus on two ideologically identifiable subgroups: the five most conservative members of the Rehnquist Court,\textsuperscript{196} and the eight most liberal justices who served for at least nine years on the Rehnquist or Burger Courts.\textsuperscript{197}

As reported in Table X, the liberals and conservatives seem to have relied on both language and substantive canons as support for their pre-existing ideological preferences, with one qualification discussed briefly below. Thus, our eight liberal justices authored slightly more than three liberal majority opinions for every two conservative ones, and they maintained that same approximately 3:2 ratio for majorities that relied on language canons as well as majorities

---

\textsuperscript{195} Of the 12 cases making use of this canon in our dataset, six have reached liberal outcomes, five conservative, and one decision was indeterminate. In the Rehnquist era, five majority opinions have relied on the constitutional avoidance canon: two reached conservative results while three were liberal decisions.

\textsuperscript{196} Four of the five conservatives, Justices Rehnquist, Scalia, Thomas and Kennedy, voted for individual employees or unions (against employer, business, or government related positions) between 28\% and 38\% of the time, based on Spaeth issue codes. The fifth conservative, Justice O’Connor, voted for individual employees or unions 46\% of the time. See n.87 \textit{supra} (explaining liberal and conservative voting scale, with vote scores for each justice). We omitted Justices Powell, Burger, and Harlan because of our interest in focusing on the dynamic at work within the reigning conservative majority on the Rehnquist Court. These three moderately conservative justices (Spaeth scores of 45.1\%, 41.1\%, 49.8\%) are part of our reference category for regressions.

\textsuperscript{197} Two of the eight liberals, Justices Marshall and Brennan, voted for individual employees or unions more than 78\% of the time under the Spaeth issue codes, while a third liberal, Justice White, supported individuals 60\% of the time. The five other liberals, Justices Stevens, Souter, Ginsburg, Breyer, and Blackmun, voted for individuals between 62\% and 73\% of the time. See n.87 \textit{supra}. We omitted Justices Douglas and Black because (like Justice Harlan) they served for such relatively short periods (two to six terms) during the Burger era, and omitted Justice Stewart because of his “hybrid” characterization (modestly liberal under Spaeth, modestly conservative under our dataset). These three liberal justices are part of our reference category for regressions (along with Justices Powell, Burger, and Harlan).
that relied on substantive canons. Our five conservative justices wrote slightly more than twice as many conservative majority opinions as liberal ones, and this ratio also persisted for majorities that relied on language canons. We ran a series of regression equations to see if we could detect either a “neutralizing effect” (justices are less ideological than normal when relying on canons) or a “magnifying effect” (justices relying on canons become even more ideological than normal) in the use of canons by our eight liberal or five conservative justices. In each of our equations, the results for the ideological variables were not close to significant. Overall, the use of canons was not associated with either a more liberal or a more conservative set of outcomes for either of these two ideologically distinct groups.

These findings of a “supporting effect” do not mean that the justices have consciously manipulated the canons to serve their respective policy objectives. Nor should the effect be

---

198 The exact ratios are 63:37 liberal for all cases, 62.5:37.5 liberal for language canon cases, and 64:36 for substantive canon cases.

199 The exact ratios are 68:32 conservative for all cases and 69:33 conservative for language canon cases.

200See Table XII infra for basic multinomial model: neither “directional justice” variable was close to significant. We also looked separately at decisions involving only the conservative subgroup and liberal subgroup; the decision outcome variable was not close to significant for either subgroup. Copies of these subgroup regression results are on file with authors.

201 The “N” of 507 includes 36 indeterminate majorities (neither liberal nor conservative) authored by these 13 justices: 28 authored by liberal justices and 8 by conservative justices. For this reason, the percentages in Table X do not add up to 100 for either liberal or conservative justices.
understood to imply, for example, that liberals’ reliance on the canons was the driving force enabling them to justify the liberal results they reached 60% of the time. As we noted earlier, the justices typically rely on multiple interpretive resources, and the canons may well be supportive in an ancillary rather than dispositive sense in explaining the Court’s outcome. In addition, canon reliance tells us nothing about the underlying intensity or magnitude of the ideological result—whether, for instance, liberals’ reliance occurs most often in cases that are relatively routine or that do not carry substantial policy consequences.

Our findings do indicate, however, that the canons are not having an independent effect on the justices’ decision making—in particular, they are not functioning as a set of overarching “neutral principles” in the hands of these selected justices. Put differently, the canons’ self-evident persuasiveness and logical force are not leading liberal, or conservative, justices whose opinions rely on the canons closer to the Court’s ideological center. One might counter that such a “neutralizing” hypothesis is unrealistic if not naïve. Given that the justices vote in conference on a result before they agree in writing on a set of reasons, each majority opinion inevitably must use interpretive resources to justify an already established outcome. At the same time, the canons are touted as an important and putatively neutral element in the bundle of competing, principled contentions presented to the justices by the parties and amici. Accordingly, they could in theory play at least a modestly leveling role in shaping the outcome itself.

Some scholars have implied such a role for the canons, by characterizing them as “off the rack” gap filling rules or conventional signals that enhance the predictability of statutory meaning. 202 Insofar as the language canons, for example, “embody plausible or even irresistible

202 See Eskridge & Frickey, supra note 12 at 67; Shapiro, supra note 12, at 943-45.
judgments about how words should ordinarily be understood,” such an understanding would seem to have no particular ideological orientation. Because, however, these “plausible or irresistible judgments” are more likely to be associated with liberal results in the hands of liberal justices and conservative results in the hands of conservatives, the language canons that embody them do appear to function as a form of assistance for preferred policy outcomes.

One additional aspect of Table X deserves mention. Decisions authored by our five identified conservative justices that rely on the substantive canons reach conservative results more than three times as often as liberal outcomes. While the low number of decisions involved, 24, may contribute to the absence of statistical significance, this set of outcomes is more sharply defined in ideological terms than any of our findings involving language canons, or than any group of decisions authored by the eight designated liberal justices. The finding, therefore, raises the possibility that reliance on substantive canons by the reigning Court majority may be more closely connected to ideology than it was in the past.

3. Canons and Ideology in Close Cases

Although all cases considered by the Supreme Court are in some sense controversial, the justices end up resolving many cases without disagreeing among themselves, while many others involve narrow vote margins and extended, reasoned dissents. In order to consider the possibility that highly contested decisions involving canon usage might have their own distinct policy orientation, we compare ideological outcomes for two categories of cases discussed in Part III D above: unanimous decisions and close cases. Table XI reports our results, which

---

203 SUNSTEIN, supra note 20, at 149-50.

204 When comparing the mean for decisions written by the five conservatives relying on substantive canons with the mean for such decisions by all other justices, t = .15. The overall number of such decisions (24) includes two that are indeterminate in outcome.
indicate that as a general matter unanimous decisions during our 34 year period are more likely to produce liberal outcomes, while close cases tend to yield conservative results.

*indicates t-test reveals a significant difference between close (or unanimous) decisions involving reliance on a particular type of canon and close (or unanimous) decisions not involving such reliance.

The conservative or pro-employer nature of our 148 close cases (53% conservative versus 39% liberal) warrants brief attention. Our finding may well be attributable at least in part to the political context of the appointments that have been made to the Court since 1969. Of the 11 justices who became members of the Supreme Court between 1970 and 1994, nine were selected by Republican presidents and each was more conservative in terms of relevant judicial philosophy than the justice he or she replaced.206 As the majority has gradually shifted in a conservative direction, the cases that most closely divide the Court understandably have tipped in that direction as well.207

205 Note that N of 400 consists of 252 unanimous cases (15 indeterminate) and 148 close cases (12 indeterminate); because of indeterminate cases (6.0% of unanimous; 8.1% of close), percentages in Table XI don’t add up to 100.

206 The series of replacements was as follows: Blackmun for Fortas; Rehnquist and Powell for Harlan and Black; Stevens for Douglas; O’Connor for Stewart; Scalia for Burger; Kennedy for Powell, Souter for Brennan; Thomas for Marshall. Each new justice scores more conservative on the Spaeth scale than the justice being replaced.

207 The tendency for unanimous cases to produce liberal results is consistent with judicial behavior research into the Burger, Warren, and Vinson Courts. See Saul Brenner & Theodore S. Arrington, Unanimous Decision Making on the U.S. Supreme Court: Case Stimuli and Judicial Attitudes, 9 POL. BEHAV. 75, 78-80 (1987). The authors speculate that conservative justices during this period may have felt more constrained by rule-of-law norms than did their liberal counterparts, and hence more often voted to uphold positions with which they disagreed in policy terms. Id. at 83. One possible explanation for the liberal tilt in unanimous decisions during our 34-year period is as a kind of reaction to the increasingly conservative Court. Lower courts anticipating the Supreme Court’s direction, and
More interesting for our purposes, however, is the fact that closely divided decisions in which the majority relies on substantive canons are significantly more conservative than close cases in general, and close cases in which the majority relies on language canons also have a conservative tilt. While 39% of all close cases yield liberal results, 31% of such cases relying on language canons and 24% of those cases invoking substantive canons come down in favor of employees. By contrast, Table XI indicates that unanimous opinions relying on language canons or substantive canons are neither more nor less liberal than unanimous opinions in general.

We noted earlier that Rehnquist Court justices are significantly more likely than their Burger Court colleagues to rely on both language canons and substantive canons when justifying results in close cases. That outcomes in these close, canon-invoking majority opinions turn out to be especially conservative is a result warranting further attention. At a minimum, our finding points to an ideologically conservative climate when the canons are relied upon in cases that divide the justices.

It is possible, however, that increased canon reliance in close cases is more a byproduct of ideological divisiveness than a contributing factor to it. When a Supreme Court decision is being challenged internally, the majority opinion author may well feel more pressure to develop principled and assertedly content-neutral reasons that will be viewed as persuasive by the inner

---

208 These results are significant for substantive canons when using the t-test (t = .04), although not for language canons (t = .20). Once again, the low number of decisions involved (26 close cases relying on language canons, including three indeterminate, and 21 close cases relying on substantive canons, including one indeterminate) makes it more difficult for results to achieve statistical significance.
circle of informed Court followers and perhaps by the general public as well.\textsuperscript{210} In these circumstances, the canons may take on additional value to the extent that they are perceived by judges, lawyers, and the public as relatively neutral or principled.

Yet our results suggest that this “enhanced reliance” effect is not ideologically neutral with respect to the canons: it occurs more often in close conservative decisions than close liberal ones. In close cases that reach conservative results, the majority author relies on substantive canons 19.2\% of the time, whereas for close liberal decisions the majority opinion invokes substantive canons only 8.6\% of the time. The difference is less stark for language canons, but it points in the same direction: 19.2\% of close conservative decisions rely on language canons, whereas only 13.8\% of close liberal decisions do so.\textsuperscript{211} Accordingly, it remains plausible to ask whether canon reliance in contested cases is contributing to—not simply reflecting—conservative outcomes.

In order better to understand the dynamics at work for the subset of cases in which dissents have been written, we conclude this Part with a more detailed picture of canon usage by the justices.

4. Ideology and the Tensions Between Majority and Dissent

We report the results of our multinomial logistic regression equation, in which the

\textsuperscript{209} See Tables VII & VIII supra.

\textsuperscript{210} It is noteworthy in this regard that majority opinions in close cases rely on significantly more interpretive resources than majority opinions in unanimous cases (3.45 resources on average versus 3.13, $z \leq .01$). Majority opinions in wide-margin and moderate-margin cases also invoke more resources than majorities in unanimous cases, but the increases there are slight and not significant.

\textsuperscript{211} This conservative tilt to canon reliance is further evidenced in majority opinions authored by the five Rehnquist conservatives. Of their 14 close decisions with an ideological outcome that relied on canons, all 14 reached a conservative result. Of their 18 close decisions with an ideological outcome that did not invoke canons, two (11.1\%) reached liberal results. Even for the eight liberal justices, close case outcomes they authored were slightly more conservative with canon reliance: 63.2\% liberal with reliance (12 of 19), and 68.5\% liberal without reliance (37 of 54).
dependent variable involves four possible forms of canon use in majority opinions: language, substantive, both types, or no canons. We are especially interested in the possibility that dissenting opinions might in effect challenge canon reliance, by contending that such reliance either is an effort to thwart congressional intent or reflects a selective or manipulative use of the canons as a resource. Accordingly, we include as independent variables whether the dissenting opinion relied on legislative history, on language canons, or on substantive canons. Additional independent variables address majority reliance on the eight interpretive resources other than the canons.\footnote{We do not need a reference category here, because coding of the interpretive resources does not involve mutually exclusive classifications.} We also include as control variables the ideological direction of the decision, the Court era (Burger or Rehnquist) in which it was decided, the subject matter addressed, whether the majority was written by a liberal or a conservative justice,\footnote{We rely here on our previous grouping of eight long-serving liberals and the five conservatives on the Rehnquist Court, see nn.196-97 \textit{supra} and accompanying text. We use the six other justices (Powell, Burger, Harlan, Stewart, Black, Douglas) as our reference category. We ran the same multinomial regression equation grouping liberals and conservatives solely based on the Spaeth scale, in order to be sure our interest in the Rehnquist conservative majority was not skewing results. In this alternate regression, our reference category was moderate-voting justices (45-55\% for employees)—O’Connor, Powell, Harlan, Stewart. Results were virtually identical—everything significant in Table XII was also significant in the alternate equation. Two additional variables were significant in the alternate equation: the five conservatives used language canons more than the ten liberals (p = .01), and reliance on both canons was associated with dissent invocation of language canons (p = .05). Copies of this additional regression are on file with the authors.} and the majority opinion vote margin.\footnote{We use wide-margin cases as our reference category for vote margin. In addition, we use labor relations as the reference category for subject matter. The control variable for ideological direction (which is fairly evenly distributed) is coded “-1” for conservative, “0” for indeterminate, and “1” for liberal, precluding the need for a reference category.} Table XII reports our results.

**p = .05, *p = .10

Prob>Chi-squared = .000  Pseudo R² = .22
Robust Standard Errors based on clustering by case appear in parentheses next to coefficients.
Base Category for comparison is no canons used.

Certain control variables have achieved significance.²¹⁵ The majority is more likely to

²¹⁵ We follow the common social science approach of designating regression results with p-value of .05 or less as “significant,” and results with a p-value of .10 or less as “approaching significance.” See generally DAVID MOORE, STATISTICS: CONCEPTS AND CONTROVERSIES 506-07 (4th ed. 1997). Our multinomial logistic regression includes subject matter variables because addition of those variables more accurately captures the justices’ use of different resources in the cases. See notes 76 and 139 supra. As a result, the regression employs a different unit of analysis (subject matter categories, N=701) than many of our prior analyses of canon usage (cases, N=632). While a case-based analysis makes sense for most discussions of decisions in bivariate terms, subject matter controls should be included in order for a regression to be fully specified. We have addressed issues of heteroskedasticity with respect
rely on language canons, and also on substantive canons, in opinions written during the Rehnquist era, in opinions resolving retirement issues, and in opinions that are unanimous. In addition, the majority is significantly more likely to rely on language canons in opinions that address minimum standards issues, and the relationship between reliance on substantive canons and opinions resolving constitutional issues approaches significance. All of these findings are broadly consistent with results reported in some of our earlier bivariate tables.

A number of interpretive resources also are significant with respect to one type of canon or the other. Majority opinions that rely on the language canons are significantly more likely to rely on the meaning of the text as well. This is not surprising inasmuch as reliance on such

to the lack of independence for observations from the same case, through clustering the data by case and then using the Huber-White correction to produce robust standard errors. The use of robust standard errors is the more accurate statistic for significance where heteroskedasticity is present or even possible. See generally DAMODAR N. GUJRATI, BASIC ECONOMETRICS 61-63 (3d. ed. 1995) (explaining heteroskedasticity); STATA STATISTICAL SOFTWARE: RELEASE 7.0 at 254-258 (2001) (describing how Huber-White correction is used to obtain robust standard errors).

216 For Rehnquist era opinions, results are significant for language canons and approach significance for substantive canons. For retirement issues and unanimous opinions, results are significant for substantive canons and approach significance for language canons. In addition, the relationship between majority reliance on both types of canons in the same opinion and decisions construing miscellaneous employment-related provisions is significant. Use of “both canons” in a majority opinion occurs only 18 times, and the two types of canons display quite different traits when considered separately. We comment on further results from the Both Canons category infra at note 219.

There is a statistical artifact associated with the way Stata calculates the Huber-White correction for clustering. Stata uses a point estimation technique that in this setting changes findings of zero observations for a given variable to a very small number of observations (something close to .0000001). As a result, five variables in the Both Canons results and one (constitutional matters) in the Language Canon results appear to be extremely significant in the negative direction when in fact there are no observations of any of these variables being related to the use of the canons in question.

217 The significance of Rehnquist era reliance is consistent with Table I: significance for retirement-related issues, and also minimum standards issues, is consistent with Tables III and IV. With respect to unanimous opinions, data from Tables VII and VIII indicate canons were used in the Burger years significantly more often in unanimous cases than in close decisions, and in general were invoked more frequently in unanimous opinions than in any of the nonunanimous groupings we coded. Although constitutional issues were not significant overall in Table IV (substantive canons), there was a significant increase in reliance between the Burger and Rehnquist eras.

Significance based on t-tests in bivariate analysis does not always appear in regression results because of the complex interaction among variables and the relative weight of each variable based on its N size. What appears as significant in a bivariate analysis is important for understanding the interactions between two variables, but may not be powerful enough to achieve significance in a regression model. We have chosen to report both bivariate and

74
canons will almost invariably be linked to close textual analysis. Majority opinions relying on
the substantive canons are significantly less likely to rely on agency deference. This intriguing
result suggests that when the justices choose to rely on their own policy-related norms, they are
less willing to view executive branch interpretations as persuasive authority.\textsuperscript{218} At the same time
majority opinions relying on substantive canons are more likely to invoke legislative inaction.
Such reliance on the absence of probative legislative signals suggests that the justices may be
especially attuned to evidence of congressional passivity when they decide to embrace their own
policy-related norms.\textsuperscript{219}

Finally, it is notable that when the majority relies on canons in nonunanimous opinions
the dissent is significantly more likely to rely on legislative history than when canons are not part
of the majority’s reasoning. For substantive canons, the association is significant over the entire
34 year period. For language canons, the overall result is not significant but further analysis
indicates that dissent reliance on legislative history is significant during the Rehnquist era.\textsuperscript{220} In
addition, Table XII indicates that majority reliance on language canons is associated with a

\textsuperscript{218} This diminished propensity to defer to agency interpretations does not extend to majority opinions relying on
language canons.

\textsuperscript{219} Apart from the statistical artifact described in note 216 \textit{supra}, three interpretive resources are significant or close
to significant when majority opinions rely on both types of canons. The higher likelihood of also relying on textual
meaning would seem to reflect the same link between language canons and close textual analysis identified for pure
language canon reliance. The association between majority reliance on both canons and heightened reliance on
legislative history and legislative purpose may reflect in part the opinion-writing approach of Justices Blackmun and
Stevens. Those two justices authored 11 of the 18 decisions relying on both types of canons (only one other justice
authored as many as two majorities in this category). As discussed earlier, their legal process approach typically
leads them to invoke legislative history and purpose to confirm or reinforce the apparent meaning of the text. \textit{See}
nn.168-69 \textit{supra} and accompanying text. Of the 11 majority opinions by Justices Blackmun and Stevens, 6 relied on
legislative history and 8 on legislative purpose. It is also noteworthy that none of the 18 opinions was authored by
Justices Scalia or Thomas, who are most persistently hostile to relying on these two intent-oriented resources.

\textsuperscript{220} When running the full multinomial model on only Rehnquist era cases \textit{(see} text accompanying note 191 \textit{supra}),
the association with dissent reliance on legislative history is significant (p = .04). Copies of these results are on file
with the authors.
significant increase in dissent dependence on language canons, while the relationship between majority and dissent reliance on substantive canons approaches significance. These results suggest the presence of certain competitive tensions in the Court’s interpretive approach that warrant further analysis at the individual case level.

In an effort to identify potentially illustrative cases, we compiled two lists. One consists of decisions in which the majority relies on either language or substantive canons but not legislative history, while the dissent relies on legislative history. We assume arguendo that when both majority and dissent invoke legislative history, there is likely to be reasonable disagreement about what Congress actually intended. Conversely, a majority’s reliance on canons without legislative history indicates either that no reliable evidence of legislative intent is available to support the majority position or that such evidence is viewed by the majority as inherently irrelevant. In either case, the tension between a majority that declines to rely on evidence of congressional intent and a dissent that embraces such evidence raises the possibility that the canons may be used to frustrate or undermine Congress’s discoverable preferences.

There are 21 decisions in which the majority opinion relies on language or substantive canons (but not legislative history) while the dissent invokes legislative history to supports its position. Two of the 21 are ideologically indeterminate, but of the 19 decisions that have an ideological direction, 17 are conservative in outcome. Further, 16 of these 19 cases (14 conservative) were decided by the Rehnquist Court, all between 1988 and 2003.

The second list of cases is comprised of decisions in which both majority and dissent rely

---

221 Majority reliance on both types of canons is not significantly associated with dissent reliance on either language or substantive canons or on legislative history. Because 9 of the 18 majority opinions relying on both types of canons are unanimous, the number of decisions in this grouping that include a dissent is quite small.

222 We discuss or refer to ten of these 19 decisions in Part IV B.
on the canons. Here, we were influenced by Karl Llewellyn’s famous article positing the presence of a countercanon for each canon as proof of the canons’ fundamentally indeterminate nature.\textsuperscript{223} We wondered whether a review of these “dueling canon” cases would suggest the justices’ willingness to engage one another regarding their competing reliance, and also how that inter-canon tension related to the ideological orientation of the cases.

This second list includes 33 cases, three of which are ideologically indeterminate. Of the 30 cases that have an ideological direction, 73\% (22) arose during the Rehnquist era, and 70\% (21) reach conservative results. However, there is some overlap between our two lists: ten dueling canon cases also involved dissents relying on legislative history.\textsuperscript{224} With these ten cases omitted, the ideological results are only modestly directional. There are 13 conservative and 9 liberal decisions, with 8 cases decided by the Burger Court and 14 by the Rehnquist Court.\textsuperscript{225}

IV. THE MALLEABILITY OF THE CANONS: CASE LAW ANALYSIS AND CONTENDING THEORIES

While there are doubtless further empirical assessments that would shed more light on our results, we now shift our attention to the case-specific level. We have chosen to focus on individual Court decisions that address three specific aspects of our findings. Each aspect relates to one of the principal theorized accounts of how the canons function in the interpretive process.

First, we analyze several cases that exemplify the Court’s reliance on language canons in more technical subject matter areas, and with respect to technical or procedural issues in an “ideologically charged” subject area. Following up on our discussion in Part III B, we explore

\textsuperscript{223} See Llewellyn, supra note 24. Table XII reports that majority reliance on each type of canon (language and substantive) is significantly associated with dissent invocation of that same type of canon. We extended our list, however, to include cases in which both majority and dissent relied on canons of any kind, in order to consider more fully the doctrinal implications of these canon-related tensions.

\textsuperscript{224} All ten of these cases are from the Rehnquist years; eight have conservative outcomes and two are indeterminate.
the extent to which the reasoning in these cases supports the public choice account of canon usage. Next, we consider a number of contested cases that illustrate the tension within the Rehnquist Court between reliance on canons and legislative history. This tension, described in Parts III D and E, seems to support the pessimistic assertions that canons are used to undermine identifiable legislative intent. Finally, we review certain divided decisions in which canons are relied on by both majority and dissent. These dueling canon cases, referred to in Part III E, raise troubling questions for legal process claims that the canons enhance predictability and consistency in the interpretation of statutes.

In each instance, our doctrinal discussion is meant to be illustrative rather than exhaustive. We have uncovered various patterns of canon usage in Part III, but some individual cases will relate to those patterns more clearly than others. We believe the cases discussed below are appropriate examples that help us to assess the potential applicability of our three distinct accounts. Together, they contribute to a more complex, nuanced picture of how the canons have functioned as justifications for the Court’s decisions. After examining cases in these three areas, we offer some thoughts on the role played by the canons in general, focusing on their value as well as their limitations.

A. Obscure Subject Matter and the Public Choice Account

As noted earlier, Professors Macey and Miller contend that the canons, by which they seem to mean primarily language canons, tend to be used in statutory cases of technical

---

225 Lists of all decisions referred to in text accompanying notes 222, 224, and 225 are on file with authors.

226 See notes 32-35, supra and accompanying text.

227 See Macey & Miller, supra note 13, at 663 (focusing on “content-independent justifications”); id. at 652 (using as their illustrative decision Breininger v. Sheet Metal Workers, which relies on ejusdem generis).
complexity and little ideological interest. According to Macey and Miller, these are the cases in which the justices are most likely to worry about their lack of subject matter expertise, and the possibility that they will make an embarrassing substantive or policy-related mistake. By serving as a kind of “stop-gap” to facilitate decisionmaking “in the absence of a policy-based justification,” these canons provide a “content-independent decision methodology” that often attracts unanimous or near-unanimous approval.

The results set forth in Table III and the accompanying discussion provide some support for this account. Language canons are used significantly more in decisions interpreting ERISA and other retirement-related statutes, and in minimum standards cases—both subject areas that tend to be technically complex and less visibly ideological. Further, we reported that with respect to Title VII, the Court relied on language canons in interpreting more complicated procedural facets of that ideologically charged statutory scheme. It is notable that vote margins in these Title VII procedural cases tend to be wider than for Title VII decisions in general.

One case that generally comports with this public choice account is *Universities Research Ass’n Inc. v. Coutu*, a unanimous 1981 decision authored by Justice Blackmun construing a pre-New Deal prevailing wage law. In *Coutu*, the Court held that the Davis-Bacon Act precludes a private right of action for back wages under a contract that has been administratively determined not to call for Davis-Bacon work. In addition to the arcane nature of the subject

---

228 Id. at 660-64.
229 Id. at 658.
230 Of 17 Title VII “procedural” language canon cases (see text accompanying notes 144-45, supra) eight were unanimous and four were decided by wide margins; this combined total amounts to 71% (12 of 17). For the 91 other Title VII cases, the proportion of unanimous and wide margin votes was somewhat lower (48 of 91, or 53%).
232 Act of March 3, 1931; 46 Stat. 1494, as amended; 40 U.S.C. § 276a (a) (requiring that construction contracts pay no less than prevailing wage rates, as determined by Secretary of Labor).
matter, the Court resolved the case on very narrow grounds. Justice Blackmun relied in part on the expressio unius canon, observing that because Congress in the Act had authorized a private damages remedy for back wages under certain conditions, the Court was unwilling to infer such a remedy under the different circumstances of this case. Although the federal contractor had argued that there could be no implied right of action even for a contract that contained specific Davis-Bacon wage stipulations, and Justice Blackmun recognized that the majority’s reasoning might well foreclose any implied right of action under the statute, he confined the Court’s holding to a very small universe—employees who seek judicial enforcement of Davis-Bacon wage protections with respect to contracts that never mention a right to receive Davis-Bacon wage rates. It may be that the Court’s willingness to duck potentially troubling larger issues contributed to unanimity as much as the technical and unglamorous nature of the subject matter. It should be noted that the majority opinion also relied on plain meaning of the text, specific legislative history, general legislative purpose, and agency deference to support its result.

A decade later, in Adams Fruit Co. v. Barrett, a unanimous Court invoked the

233 The Davis-Bacon Act is a 1931 statute regulating wage rates on federal construction contracts, and it is rarely litigated at the Supreme Court level. Coutu was the only Davis-Bacon decision in our 632-case dataset.

234 450 U.S. at 773.

235 Id. at 768-69.

236 Id. at 769, n.19.

237 The Court also declined to address a second argument made by the federal contractor: whether federal courts have jurisdiction to review coverage and classification determinations made by the Secretary of Labor. See id. at 768-69 & n.18.

238 See id. at 771-73 (relying on language of Act); id. at 773-780 (relying extensively on history of 1931 Act and 1964 amendment); id. at 782-83 (relying on Act’s purpose of promoting efficiency and certainty in government contracting); id. at 783 (relying on respect for Secretary’s detailed regulations fostering uniformity in contract coverage). This use of language canons as part of a broader web of interpretive resources is fairly typical of Justice Blackmun’s opinion-writing methodology. See notes 173-177 and 197-201, supra and accompanying text.

expressio unius canon to help justify a private right of action under a comparably obscure federal statute, the Migrant & Seasonal Agricultural Workers Protection Act (AWPA). The issue in Barrett was whether the right of action expressly conferred on migrant workers under the AWPA is effectively conditioned by the exclusivity provisions in state workers’ compensation laws. The employer pointed to the Act’s motor vehicle safety provisions, which permit employers to satisfy AWPA insurance policy and liability bond requirements through state workers’ compensation insurance. The employer contended that it made no sense for Congress to have waived federal insurance coverage requirements when workers’ compensation was provided and yet allow migrant workers to pursue cumulative remedies under workers’ compensation laws and AWPA.

Justice Marshall, writing for the Court, declined to allow the enforcement provisions of AWPA to be restricted by language in a separate title of the Act. Emphasizing that the enforcement provisions themselves provided one express limitation (unrelated to workers’ compensation schemes) on the availability of relief, Justice Marshall reasoned that Congress’s failure to include a further limitation was highly probative as a matter of basic statutory construction. While relying on the Act’s language and structure to preserve this AWPA right of action, Marshall did circumscribe the implications of the Court’s holding by adding that any

240 Pub. L. No. 97-470; 96 Stat. 2583, as amended; 29 U.S.C. § 1801 et. seq. This is the only AWPA case in our dataset.
241 See 494 U.S. at 643-44.
242 Id. at 644.
243 Id. at 644-45. The express provision in AWPA called for limiting the amount of damages based on whether “an attempt was made to resolve the issues in dispute before the resort to litigation.” Id. at 644 (quoting 29 U.S.C. § 1854 (c) (2)). Justice Marshall noted that the Department of Labor had taken the opposite view in its regulations, but he refused to defer to the agency in light of the Act’s linguistic and structural clarity, as well as his determination that regulating the scope of judicial power granted by the AWPA was a matter Congress had not delegated to the Department. Id. at 649-50.
AWPA damages award could be reduced in light of a farmworker’s receipt of state workers’ compensation benefits. 244

Both Coutu and Barrett involved a unanimous Court relying on the expressio unius canon to help justify its interpretation of an obscure workplace standards statute in a decision with very limited practical consequences. 245 There are ample additional decisions that conform to this general picture. Some arise under similar minimum standards statutes while others interpret certain provisions of ERISA; the Court frequently relies on language canons besides expressio unius to help explain its holdings in such decisions. 246

While Professors Macey and Miller suggest that judges tend to opt for such language canon reliance in cases where the policy choices of the political branches are essentially unknown, 247 that overstates the matter. The Court in these cases often does invoke purposive justifications—gleaned from or imputed to Congress—thereby attributing its result in part to the policy preferences of the legislative branch. 248 In addition, there are occasions when the relevant executive branch agency has advanced its own policy-based interpretation but the Court is

244 Id. at 651 n.5.
245 The result in Coutu was conservative (prohibiting the employee’s federal lawsuit) while in Barrett the outcome was liberal (preserving the employee’s federal cause of action).
246 See, e.g. Moreau v. Klevenhagen, 508 U.S. 22 (1993) (relying inter alia on Whole Act Rule to hold unanimously that under FLSA section regulating comp time for government employees, a public employer in a right to work state may provide comp time pursuant to individual agreements with each employee, even though the employees have designated a union representative to negotiate for such arrangements); Commissioner of Internal Revenue v. Keystone Consolidated Indus. Inc., 508 U.S. 152 (1993) (relying in part on canon that same words used in different parts of a statute are meant to have the same meaning to hold (by 8-1 margin) that an employer’s transfer of certain property to a defined benefit plan in partial satisfaction of its funding obligation was a prohibited “sale or exchange” under ERISA); Milwaukee Brewery Workers’ Pension Plan v. Jos. Schlitz Brewing Co., 513 U.S. 414 (1995) (relying inter alia on Whole Act Rule to hold unanimously that under Multiemployer Pension Plan Amendments Act, interest on the charge for withdrawal from a pension plan begins to accrue on first day of plan year following withdrawal rather than last day of plan year preceding withdrawal).
247 See Macey & Miller, supra note 13, at 659.
248 See, e.g., Coutu, 450 U.S. at 773-80, 782-83; Keystone, 508 U.S. at 160; Schlitz 513 U.S. at 428-30.
simply unwilling to defer.\textsuperscript{249} Still, it seems fair to say that in cases interpreting procedural or remedial aspects of relatively lackluster federal laws, where the outcome is at best of modest practical importance, the Court is especially inclined to use maxims of linguistic meaning and structure to help justify its results.

It may be, as Macey and Miller suggest, that such facially content-neutral rationales help to insulate the justices from error or embarrassment in areas where they feel less confident about either their substantive expertise or their policy preferences. It seems more likely to us, however, that the justices in these cases are less personally invested rather than less confident. Their willingness to invoke the language canons is due—consciously or subconsciously—to diminished appetite for the subject matter, an understanding that the practical stakes are not terribly high, or some combination of these factors.

Apart from the weaker substantive interest generated by such cases, the relatively precise and detailed nature of the provisions being interpreted may also help to explain why the justices rely more often on language canons. The Court in both \textit{Coutu} and \textit{Barrett} was called upon to construe intricate statutory terms covering the relationship between possible private rights of action and the role specified for other regulatory actors. The elaborately complicated aspects of these interpretive controversies stand in contrast to instances of Congress’s more open-textured drafting. Statutory directives that simply prohibit employers from “restrain[ing] or coerce[ing]” workers who seek to organize a union,\textsuperscript{250} or from “discriminat[ing]” against employees because

\textsuperscript{250} \textit{See 29 U.S.C. § 158(a)(1) (2000).}
of race or sex, effectively delegate broader interpretive authority to agencies and courts; such provisions lack the more particularized verbiage that invites close linguistic analysis. It is worth noting in this regard that the controversies addressing Congress’s more detailed and close-textured legislative products often require interpretation of jurisdictional, remedial, or procedural provisions that are perceived to have analogs in other statutes or elsewhere within the same statute. In these circumstances, the justices may find the cross-referential nature of language canon analysis a relatively comfortable methodological fit.

This explanation, keyed to the specificity and structural context of the provision at issue, may apply as well for subject matter areas that are not at all esoteric, such as Title VII. We described earlier our finding that the Court’s reliance on language canons when interpreting Title VII is strongly associated with procedural and technical aspects of that ideologically sensitive statute. A good example of this association is *Robinson v. Shell Oil Co.*, a unanimous 1997 decision authored by Justice Thomas.

In *Robinson*, the issue presented was whether Title VII’s anti-retaliation provision, § 704(a), protects former employees as well as current ones, specifically a former employee who alleged that Shell Oil had given him a poor reference in retaliation for his having previously filed a race discrimination charge with the EEOC. The language of § 704(a) prohibits discrimination by an employer “against any of his employees or applicants for employment” who have filed a charge, testified, or otherwise assisted in an EEOC investigation. The Court of

---

252 See notes 146-151 supra and accompanying text.
254 Id. at 339-40.
Appeals had held that this language was clear on its face: “employees” referred only to current employees, and an anti-retaliation claim by a former employee was therefore not cognizable. The Supreme Court reversed, relying heavily on the Whole Act Rule while declining to make use of language canon analysis that pointed in the opposite direction.

Justice Thomas initially determined that against the background of Title VII as a whole, the term “employees” in § 704(a) was ambiguous with respect to excluding former employees. Thomas reasoned that neither the basic definition of “employee” within the Act nor treatment of the term in legal dictionaries included a clear temporal qualifier. Importantly, Justice Thomas recognized that Congress in a number of other laws had identified “former employees” as a class separate from current employees, but in his view this “prove[d] only that Congress can use the unqualified term “employees” to refer only to current employees, not that it did so in this particular statute.” The Court thus rejected reliance on the linguistic maxim that Congress uses the same term consistently in different statutes, a canon that has attracted some scholarly criticism but also frequent adherence from the justices, including in decisions that interpret Title VII.

Instead, the Court focused on a number of other places in Title VII where the term

---

256 Cite to 70 F. 3d 325, 329-30 (1995) (4th Cir) (en banc).
257 519 U.S. at 341-42. Justice Thomas acknowledged that the Court only weeks earlier had interpreted the word “employees” appearing in a separate section of Title VII as referring to those having a current employment relationship, but he distinguished the prior holding because that different section included a present-tense qualifier in its discussion of “employees.” Id. at 341 & n.2.
258 Id. at 341-42 (emphasis in original).
259 See William W. Buzbee, The One-Congress Fiction in Statutory Interpretation, 149 U. Pa. L. Rev. 171, 234-40 (2000) (contending that such reliance on inter-statutory references is prone to judicial manipulation and will unsettle bodies of federal law not before the court).
260 See id. at 180-203 (citing to multiple decisions between 1991 and 2000 in which use of what Buzbee calls the “one-Congress fiction” was a driving force in the result reached by the Court).
“employees” plainly did encompass former employees, notably provisions specifying access to the statute’s remedial mechanisms. Consideration of this broader context, including the fact that § 704(a)’s protection for filing a “charge” would seem inevitably to embrace charges by former employees alleging unlawful termination, led the Court to conclude that the genuinely ambiguous word “employees” in § 704(a) should be read to cover former employees. Justice Thomas then invoked legislative purpose as “further support” for the majority’s position, observing that it would undermine the basic concept of anti-retaliation protections to hold that they expire as soon as an employee leaves the job or is terminated.

In Robinson, as in many other procedural or jurisdictional Title VII decisions that rely on language canons, the justices are well aware of the policy implications involved. Moreover, these implications are hardly unimportant in practical terms: a determination that anti-retaliation protections covered only current employees would presumably have had a severely chilling effect on individuals wishing to invoke agency procedures under the Act. Still, Justice Thomas devotes almost all of his analysis to arguments about the meaning and structure of the statutory language, saving only his final two paragraphs for discussion of congressional purpose as supplemental reinforcement.

Admittedly, Justice Thomas—a textualist and frequent language canon user—may be

262 See 519 U.S. at 342-43 (referring to meaning of “employees” in sections 706 (g) (1), 717 (b), and 717 (c)).

264 Id. at 345-46.
especially inclined to dwell on parsing the language of key provisions and analyzing the interplay among detailed subparts of a complex statutory scheme. But the Court’s comfort level with these refined language canon analyses extends to nontextualist justices as well.267 Language canon usage is inevitably a byproduct of assessing the statutory text, and this consideration is likely to occur early in the Court’s interpretive reasoning processes. When the language of that text deals with procedural, jurisdictional, or remedial matters that recur in other statutory settings, or in different parts of the statute being construed, language canons seem to play a more important role.

In sum, it is unlikely that the justices’ more frequent language canon reliance, associated with several relatively obscure areas of substantive law and more generally with technical matters that are codified in some detail, occurs out of ignorance regarding the policy preferences of the other two branches, or out of a desire to avoid making a policy mistake. Rather, their reliance may well be a function of two other motives that are distinct yet overlapping. The justices’ inclination to invoke language canons in this subset of cases would appear to reflect a relative lack of interest in certain esoteric subject matter areas, and a relative comfort level with the intra and inter-statutory frames of reference afforded by certain types of procedurally-related issues. It is even possible that the first of these motives may have helped to encourage the second, at least in cases that are decided with little or no dissent. The wide margin of support in many obscure or technical decisions may reflect the justices’ comparatively softer investment in “taking sides” on such matters. Justices adopting this somewhat more relaxed stance may then find it easier to embrace an interpretive approach that takes an aspirational view of congressional

267 See, e.g., Yellow Freight System, supra note 261 (majority opinion by Justice Stevens); Loeffler, supra note 265 (majority opinion by Justice Blackmun); Associated Dry Goods Corp, supra note 265 (majority opinion by Justice Stewart).
lawmaking as a linguistically integrated and harmonious enterprise.

B. Pessimists’ Perspective: Tension Between Canons and Legislative History

Professors Ross and Rubin each have warned against the dangers that courts will use canons to frustrate readily discernible congressional intent. Their concern reflects the existence of periodic tension between invocation of the canons and reliance on legislative history, a tension that has become more prominent in recent times. As Professor Manning observed in an article chronicling the revival of the canons, to the extent there are misgivings about “the judicial capacity to find . . . legislative intent or purpose, it may seem important, if not essential, to emphasize and develop effective rules of thumb to resolve the doubts that inevitably arise out of statutory language.”

Our findings document a brisk competition involving these two interpretive approaches, in the connection between majority reliance on canons and dissent use of legislative history, and also the contrast between the rising influence of the canons as an interpretive justification and the Court’s diminished reliance on legislative history.

There is no intrinsic reason why the results of such tension should point in a single ideological direction. Legislative history at times reveals conflicting or overlapping motivations among members who supported enactment, and even those who bristle at Judge Leventhal’s famously sardonic observation would concede that legislative history may contain credible evidence of divergent rationales. To be sure, Justices Scalia and Thomas—frequent users of

268 Ross, supra note 15, at 562; Rubin, supra note 15, at 580.
269 Manning, supra note 11, at 285.
270 See Table XII and accompanying discussion supra; notes 125-135 supra and accompanying text.
271 Judge Leventhal once referred to legislative history as a way of “looking over a crowd and picking out your friends,” quoted in Wald, supra note 46, at 214. Notwithstanding this critical comment, Judge Leventhal regularly relied on legislative history in justifying his decisions while a member of the D.C. Circuit. See, e.g., AFL-CIO v.
language canons—have publicly renounced relying on legislative history in their majority opinions. But this refusal, adopted and applied as a matter of principle, appears on its face to be ideologically neutral. Moreover, 13 other justices authoring majority opinions during the Rehnquist era continue to regard legislative history as potentially probative. They too are part of the sharply increased willingness to rely on both language and substantive canons, and Justices Scalia and Thomas have in fact contributed only modestly to our pool of majority opinions pitting canons against legislative history.\footnote{272}

Accordingly, it is striking to find such an overwhelmingly conservative set of results for the 19 decisions in which majority reliance on canons clashes with dissent dependence on legislative history: eight of nine language canon cases and nine of ten substantive canon cases. We reported earlier the findings that in closely divided decisions, the majority’s reliance on canons tends to produce conservative outcomes,\footnote{273} and that canon reliance is significantly associated with greater dependence on legislative history in dissent.\footnote{274} Overall, this polarized pattern suggests that for an identifiable subset of divisive cases, the canons are being used by the Rehnquist Court to help produce a judicially desired set of policies, ignoring or sacrificing legislatively expressed preferences in the process. We consider in some detail five cases—three

\footnote{272} Of the 19 ideologically directional majority opinions referred to in note 222 \textit{supra}, Justices Scalia or Thomas authored a total of three. Of the ten majorities analyzed or referred to in this subpart, Justices Scalia and Thomas authored one each: the rest were written by Justices Kennedy (3), O’Connor (2) Rehnquist, White, and Powell.

\footnote{273} See Table XI \textit{supra}.

\footnote{274} See Table XII \textit{supra} and accompanying discussion. The tension between canons and legislative intent takes on a more subtly ideological flavor when the two interpretive resources have inverted roles. Of the eight contested decisions in which the majority (but not dissent) relied on legislative history while the dissent invoked \textit{language} canons, seven reached liberal results. \textit{See, e.g.}, Holly Farms Corp. \textit{v.} NLRB, 517 U.S. 392 (1996); West \textit{v.} Gibson, 527 U.S. 212 (1999); Barnhart \textit{v.} Peabody Coal Co., 537 U.S. 149 (2003). Of the five contested decisions in which the majority (but not dissent) relied on legislative history while the dissent invoked \textit{substantive} canons, four reached
involving language canons and two substantive canons—that present specific examples of this pattern.

1. Language Canon Reliance

In *Mertens v. Hewitt Associates*, a closely divided 1993 ERISA decision, the Court held that a nonfiduciary who knowingly takes part in the breach of a fiduciary duty imposed under the Act is not liable for consequent monetary losses suffered by employee benefit plan participants. The case involved a class of former salaried employees at Kaiser Steel who alleged that they had received substantially reduced pensions. Their claim against Hewitt, the plan actuary, was for a breach of professional duties: Hewitt’s knowing use of flawed actuarial assumptions and its failure to disclose that Kaiser had not adequately funded the plan resulted in there being insufficient assets to cover the retiree’s fully vested pensions. The question before the Court was whether § 502(a)(3) of ERISA, which authorizes plan participants to sue for “appropriate equitable relief to redress . . . violations,” covered an action for monetary damages against nonfiduciaries in these liability-producing circumstances.

Writing for a five-member majority, Justice Scalia held that the answer was no. The conservative results and the fifth was indeterminate. See, e.g., FMC v. Holliday, 498 U.S. 52 (1990); Gade v. National Solid Wastes Mgmt. Ass’n, 505 U.S. 88 (1992).

277 Id. at 250-51.
279 The Court assumed *arguendo* that the facts alleged would qualify as a violation of ERISA by nonfiduciary Hewitt, although the majority expressly reserved the liability question for another day. Id. at 254-55.
280 Id. at 251-63. Joining Justice Scalia’s opinion were Justices Blackmun, Kennedy, Souter, and Thomas. Justice White’s dissent was joined by Justices Rehnquist, Stevens, and O’Connor. The presence of Blackmun and Souter in the majority, and Rehnquist and O’Connor in dissent, makes this a somewhat unusual lineup.
majority opinion relied heavily on plain meaning and language canons. Justice Scalia insisted that the term “equitable” in connection with “relief” should be understood to cover only remedies traditionally available at equity, *i.e.* not monetary damages which constitute *legal* relief.\(^{281}\) He then made use of the “consistent usage across statutes” canon, emphasizing that the Court had construed very similar language in Title VII to foreclose access to compensatory or punitive damages.\(^{282}\) Justice Scalia also relied on the Whole Act Rule, reasoning that if “equitable” relief in § 502(a)(3) were construed to include damages, this would vitiate the meaning of distinctions Congress had drawn elsewhere in ERISA between “equitable” and “legal” relief.\(^{283}\) The majority acknowledged that under the common law of trusts, courts of equity had authority to award money damages in actions by beneficiaries, both against a trustee for breach of trust and against third parties who knowingly participated in the breach.\(^{284}\) The Court reiterated, however, that “equitable relief” must mean something less than “all relief,” and accordingly declined to impose a “strained interpretation” on § 502(a)(3).\(^{285}\)

The dissent, written by Justice White, relied heavily on legislative history and purpose to support its argument for a broader meaning of the phrase “equitable relief.”\(^{286}\) Justice White pointed to comments in both House and Senate committee reports, and also remarks by chief Senate sponsor Senator Williams; these statements reflected an intent that the courts rely on settled precedents under the common law of trusts in shaping the contours of breach of trusts law

It was well established when ERISA was being enacted that the traditional “equitable” relief available to trust beneficiaries included compensatory damages, and the dissent accordingly maintained that § 502(a)(3)’s reference to “appropriate equitable relief” was meant to cover make-whole monetary awards, “equity’s routine remedy” for breaches of trust like the one at issue here. Indeed, the dissent added, given Congress’s overriding purpose of protecting participants in ERISA-governed plans, and the broad preemption of state law in other parts of the Act, it would be nothing less than subversive to construe key remedial language so as to leave the protected class worse off than they had been before enactment of ERISA.

As noted above, Justice Scalia agreed with the dissent that plan participants would have been entitled to recover under the common law precedents in effect when ERISA was enacted. The majority also acknowledged the dissent’s reliance on legislative purpose, but Justice Scalia referred disparagingly to “vague notions of a statute’s ‘basic purpose’ [as being] inadequate to overcome the words of its text regarding the specific issue under consideration.” The majority made no effort to confront the evidence of legislative intent invoked by the dissent, evidence the Court had found probative on other occasions. Although Justice White offered a textual

REV. 1317, 1354-55 (2003) (criticizing Court for refusing to confront ERISA’s remedial purpose and for relying on “specificity myth” that statute’s careful and comprehensive drafting warrants excluding all details of practice not spelled out in text).

291 508 U.S. at 264 (citing to Firestone (1989) and Central States (1985)).
reading that took issue with the majority’s plain meaning analysis, this too did not dissuade Justice Scalia from adhering to a purely linguistic approach.

The majority’s one concession to the possibility that it might be thwarting congressional intent came in the final paragraph of its opinion. Justice Scalia posited a “tension” between ERISA’s “primary goal” of protecting beneficiaries and a “subsidiary goal” of containing pension plan costs—notably defraying the higher insurance costs that would be imposed on actuaries—and he concluded that the text here favored the subsidiary purpose. There is certainly a prospect of increased transaction costs flowing from the federal imposition of monetary remedies on nonfiduciaries. Indeed, such a prospect is present for any ERISA standard that has the effect of benefiting employees and retirees. The majority, however, points to no evidence that Congress was concerned about these particular costs when key legislative players urged reliance on remedial standards established under the common law of trusts. Instead, by elevating what it concedes is the “subsidiary” goal of cost-containment over the primary goal of protecting plan participants, the majority seems to be relying on its own policy preferences favoring business efficiency. The Court’s result leaves Mertens (and large numbers similarly situated) worse off than both sides agree they were before ERISA. One is hard pressed not to view such results as frustrating the Act’s generally recognized purpose, and the majority’s linguistically driven reasoning is largely indifferent to that concern.

Our second example, Sutton v. United Air Lines, involves a divided Court in 1999

292 Id. at 267-69.
293 Id. at 263.
294 See Bellace, supra note 276, at 616.
interpreting the Americans With Disabilities Act (ADA)\textsuperscript{296} to mean that corrective and mitigating measures should be considered when determining whether an individual is disabled, thereby restricting the Act’s potential scope of coverage. Sutton and her twin sister, who were afflicted with severe myopia, had applied for jobs with United as commercial pilots. Although they met the company’s basic qualifications (both were experienced, FAA-certified pilots), they were not offered a position because they did not meet United’s minimum standard for uncorrected visual acuity.\textsuperscript{297} The main issue presented was whether, in interpreting the Act’s applicable definition of disability—“a physical or mental impairment that substantially limits one or more of the major life activities”\textsuperscript{298}—a court should take account of corrective measures (such as eyeglasses, medications, or prosthetic devices) that mitigate the individual’s impairment.

Justice O’Connor wrote for seven members of the Court, concluding that the approach adopted by the EEOC and the Department of Justice, that individuals were to be evaluated in their hypothetical uncorrected state, was an impermissible interpretation of the ADA.\textsuperscript{299} Relying heavily on the Whole Act Rule, the majority reasoned that the ADA was unambiguous on this issue and therefore declined to consider the available legislative history.\textsuperscript{300}

The Court discerned clear meaning based in part on the phrase “substantially limits,” which in its view mandated individualized inquiry into whether a particular person is actually disabled, as opposed to the EEOC’s “speculat[ive]” approach as to how an uncorrected

\begin{flushleft}
\textsuperscript{297} 527 U.S. at 475-76.
\textsuperscript{298} 42 U.S.C. § 12102(2)(A). The Court also addressed a separate aspect of this definition—whether Sutton should be “regarded” as having a substantial impairment under 42 U.S.C. § 12102(2)(C). We do not discuss that part of the majority opinion, as it does not rely on language canons. See \textit{527 U.S.} at 489-94.
\textsuperscript{299} \textit{Id.} at 482.
\textsuperscript{300} \textit{Ibid.}
\end{flushleft}
impairment tends to affect groups of people.\textsuperscript{301} But the lynchpin for the majority opinion was the ADA’s findings section, which declared that “some 43,000,000 Americans have one or more physical or mental disabilities.”\textsuperscript{302} Although Justice O’Connor expressed uncertainty about the origins of this 43 million figure, she reasoned that it could not possibly be squared with an “uncorrected” approach that would cover 100 million people or more.\textsuperscript{303} In order to avoid rendering the 43 million number meaningless, the Court concluded that this figure “gives content to the ADA’s terms, specifically the term ‘disability.’”\textsuperscript{304}

In dissent, Justice Stevens disputed the majority’s position that the text was unambiguous, and contended that it was therefore proper to consult the Act’s legislative history.\textsuperscript{305} Writing for himself and Justice Breyer, Stevens observed that eight of nine circuits to address the issue, and all three executive agencies to construe the language, had concluded that Congress intended disability determinations to focus on individuals in their unmitigated condition.\textsuperscript{306} He found this widely shared conclusion wholly unsurprising given the readily available legislative history that was directly on point.

Justice Stevens then quoted extensively from House and Senate committee reports on the bill that became the ADA. These reports explicitly and repeatedly discuss various examples of correctable impairments that are meant to be covered under the Act.\textsuperscript{307} The reports also cite with

\item\textsuperscript{307} \textit{Id.} at 499-501 (quoting Senate and House reports expressly stating that persons who are hard of hearing, or who suffer from epilepsy, heart disease, or diabetes, are covered under the first prong of the definition of disability (42
approval the fact that the ADA definition of disability, borrowed almost verbatim from the Rehabilitation Act of 1973, had been interpreted to cover such correctable impairments by lower courts applying that earlier definition. In light of this powerful legislative record, Justice Stevens maintained that it was preferable to view the reference to 43 million as a speculative estimate rather than wrapping the Act’s critical definition around that figure. He reinforced this view by noting that the majority definition might well bring the scope of coverage well below 43 million.

It is worth noting how the majority and dissent in Sutton essentially draw conflicting inferences from the same definitional text. While they agree that Congress contemplated an individualized approach to coverage, they differ about the sequence for arriving at such individual determinations. Justice O'Connor, insisting that the Act focuses on persons in a “corrected” condition, views those who are epileptic or have artificial limbs as potentially covered by the Act if they are found to be “substantially limited” even when using corrective medication or devices. By contrast, Justice Stevens, who asserts that the Act contemplates assessment of “uncorrected” conditions, regards persons with routine eyeglasses as potentially excluded upon a determination that even in their uncorrected state they are only modestly or trivially impaired. Disagreement among the justices about the implications of a less than precise text are fairly common. Yet in this instance, there is legislative history that is strikingly

U.S.C. § 12102(2)(A)) even though their medical conditions may be corrected through hearing aids or controlled through medication).

definitive and uncontroverted on the very implications in dispute. By holding that the
definitional issue is unambiguously resolved based on reference to a numerical figure in the
findings section of the Act, the majority relies on a structural canon to foreclose all consideration
of specific legislative intent. Once again, the result can be seen as undermining that intent.

Our final language canon example is Circuit City Stores Inc. v. Adams,313 a 2001 decision
interpreting the Federal Arbitration Act (FAA).314 In Circuit City, a consumer electronics
company required job applicants to agree to final and binding arbitration of future job-related
disputes as a condition of their employment. Adams, a salesman, had signed the agreement but
he later filed an employment discrimination lawsuit in court; Circuit City then sought to compel
arbitration under the FAA.315 The Supreme Court had to decide whether § 1 of the statute,
exempting “contracts of employment of seamen, railroad employees, or any other class of
workers engaged in interstate commerce” 316 applied to all employment contracts. The Court had
earlier interpreted the FAA’s basic coverage language—providing for the enforceability of
written arbitration provisions that are part of “any maritime transaction or a contract evidencing a
transaction involving commerce”317—as signifying Congress’s intent to regulate to the full
extent of its commerce power.318 Writing for five members of the Court, Justice Kennedy
concluded that the § 1 exemption was much narrower, covering only employment contracts of
transportation workers.

Justice Kennedy relied primarily on language canons and plain meaning analysis; as was

315 532 U.S. at 109-10.
true in *Sutton*, the majority found the text at issue to be so unambiguous that it refused to consider the legislative history. The language canon the majority found highly probative was *ejusdem generis*, which calls for a general term to be interpreted to embrace only the class of objects enumerated in more specific terms that accompany it. Because the residual clause “any other class of workers engaged in interstate commerce” is preceded by reference to two specific types of transportation workers, the majority reasoned that the clause should be confined in scope to those employed in transportation-related enterprises. Justice Kennedy reinforced this language canon reliance by conducting a comparative linguistic analysis of the phrases Congress had chosen to modify “commerce” in §§ 1 and 2 of the FAA. He stressed that the phrase “involving commerce” used in the Act’s basic coverage section (§ 2) must be construed broadly, connoting an almost passive accretion of jurisdiction to the outer limits of Congress’s authority under the Commerce Clause. By contrast, the phrase “engaged in commerce” used in the Act’s exemption section (§ 1) signifies a more limited scope of jurisdiction, triggered only by active participation in commercial employment.

Four members of the Court used two separate dissents to take strong issue with the majority’s invocation of an unambiguous text. Justice Souter contended that the different phrasings of the two commerce provisions should not be given any weight. In his view, it was

319 532 U.S. at 119.
320 *Id.* at 114-15.
321 *Id.* at 115.
322 *Ibid*.
323 *Id.* at 115-16.
324 *Id.* at 124-40. Souter’s dissent (joined by Stevens, Breyer and Ginsburg) contested the majority’s textual analysis. Stevens’ dissent (joined by Souter, Breyer and Ginsburg) focused on the FAA legislative history.
most plausible to infer from the text as a whole that Congress meant for the basic coverage provision and the employment exemption provision to be coextensive.\textsuperscript{325} Pointing to the “context of the time,” Souter observed that when Congress acted in 1925 its regulatory power was confined under prevailing Supreme Court doctrine to the active operations of interstate commerce.\textsuperscript{326} References to seamen and railroad workers in § 1 should therefore be understood as something besides mere ahistorical illustrations of how language can be parsed. Instead, argued Souter, Congress’s evident intent in § 1 was “to exclude to the limit of its power to cover employment contracts in the first place, and it did so just as clearly as [§ 2] showed its intent to legislate to the hilt over commercial contracts at a more general level.”\textsuperscript{327} Justice Souter further noted that \textit{ejusdem generis}, like other canons, “is a fallback” to be put aside “if there are good reasons not to apply it.”\textsuperscript{328} He found such reasons, pointing to the Act’s legislative history as well as the bizarre implications of holding that Congress in 1925 had targeted for exemption only those employees it most obviously \textit{could} regulate while leaving regulated all other employees over whom its authority was highly suspect.\textsuperscript{329}

Justice Stevens’ dissent analyzed the FAA legislative history that the majority had determined was irrelevant.\textsuperscript{330} When the FAA was introduced in response to judicial refusals to enforce commercial arbitration agreements, the bill was understood by members of Congress to

\begin{footnotes}

\footnote{326}{\textit{Id.} at 136.}
\footnote{327}{\textit{Ibid.}}
\footnote{328}{\textit{Id.} at 138.}
\footnote{329}{\textit{Ibid.} Justice Kennedy countered that the exclusion of seamen and railroad employees need not be viewed as irrational or anomalous, because by 1925 Congress already had enacted specific legislation providing for arbitration of seamen’s disputes and it was contemplating such legislation for railroad employees (eventually enacted in 1926). \textit{See id.} at 120-21. This argument did not, however, address the other half of Justice Souter’s asserted anomaly—an almost casually imposed national coverage for all other workers outside the transportation industry while the most “regulable” employees were excluded.}
\end{footnotes}

99
cover commercial and admiralty contracts.\textsuperscript{331} Although the bill’s supporters did not anticipate that it would extend to employment contracts at all, organized labor objected strongly to the possibility of such coverage.\textsuperscript{332} In response, Secretary of Commerce Herbert Hoover suggested adding language to exempt employment contracts: when that suggested language became the relevant portion of § 1, organized labor withdrew its opposition and advised its members that Congress had indeed “exempted labor from the provisions of the law.”\textsuperscript{333} Justice Stevens concluded that by reading the disputed exemption language to be confining rather than comprehensive, the majority had in fact “defeat[ed] the very purpose for which [the] provision was enacted.”\textsuperscript{334}

The majority’s canon-based reasoning is difficult to defend in content-neutral terms. Even if one does not embrace Justice Souter’s interpretation, promoting a coherent interaction between the FAA’s coverage and exemption provisions, it seems impossible to view the majority’s linguistic analysis as so obviously correct that it renders irrelevant any consideration of legislative intent. By ignoring legislative history, the majority has accomplished the exact opposite of what the enacting Congress intended. Further, by construing this 1925 text to allow arbitrators instead of courts to resolve employees’ claims of discrimination against their employers, the majority has undermined more recently articulated congressional preferences favoring judicial access to vindicate specific federal civil rights protections.\textsuperscript{335} In this regard, it

\textsuperscript{335} See Charity Robl, \textit{Recent Developments:} Circuit City Stores, Inc. v. Adams, 17 OHIO ST. J. ON DISP. RES. 219, 226 (2001) (suggesting that Court’s decision undermines congressional intent under Title VII, ADEA, and ADA);
is worth noting that many nationally prominent interest groups filed *amicus curiae* briefs in *Circuit City*, and the justices presumably understood the policy stakes of the issue before the Court.\(^{336}\) Under all these circumstances, the putatively neutral interpretive approach followed in *Circuit City* seems an especially stark instance of judicial policymaking.\(^{337}\)

2. *Substantive Canon Reliance*

Unlike language canons, substantive canons are generally invoked to support a judicial policy preference. Given the Court’s gradual shift in a conservative direction during this 34-period,\(^{338}\) one should perhaps expect to find in divided cases a prevailing conservative cohort of justices who often embrace substantive canons reinforcing their own ideological perspective. It may therefore be less surprising that majority reliance on substantive canons in the face of dissent dependence on legislative history points so powerfully in a conservative direction, especially during the Rehnquist era.

One substantive canon prominently associated with the Court’s conservative majority since the mid-1980s is the “superstrong clear statement rule” promoting constitutional norms of

336 *See* 532 U.S. at 108 (listing nine amicus briefs supporting employer’s position from *inter alia* Chamber of Commerce, Securities Industry Association, and Society for Human Resource Management, and eight amicus briefs supporting employee’s position from *inter alia* Lawyers Committee for Civil Rights Under Law, American Association of Retired Persons, and Association of Trial Lawyers of America. In the interests of full disclosure, we note that one of us (Brudney) was a signatory on an amicus brief filed by a group of law professors supporting the employee position.

338 *See* note 206 *supra* and accompanying text.
federalism. As formulated by the Court, the canon provides that unless Congress has been unmistakably clear in text that it means to limit the states’ core sovereign authority so as to alter “the usual constitutional balance,” the Court will interpret the federal statute as not having accomplished that purpose. Our database includes decisions relying heavily on this canon to hold that Congress was not sufficiently clear in its enacted text so as to limit the states’ sovereign authority under § 504 of the Rehabilitation Act, under § 1983 of the 1871 Civil Rights Act, or pursuant to § 11(f) of the Age Discrimination in Employment Act. The majority opinion in each of these cases deems legislative history irrelevant in light of its stringent clear statement approach. In each case, a dissent points to legislative history as evidencing Congress’s clear understanding that it meant to subject states to the sovereign authority of Congress.

The Court’s superstrong clear statement rule protecting states’ sovereign authority has drawn considerable attention from legal scholars. Critics have contended that the imposition of this canon allows the Court to undermine what at time of enactment was settled congressional intent, and also to circumvent the Court’s own constitutional precedent holding that our federal political structure adequately protects the states’ core sovereignty interests. Because debate about the normative implications of the canon has been fully joined elsewhere, we will not dwell

339 See Eskridge, Frickey & Garrett, supra note 37, at 889.
344 See Atascadero, 473 U.S. at 248-50 (Brennan, J., dissenting); Will, 491 U.S. at 83-85 (Brennan, J., dissenting); Gregory, 501 U.S. at 489-93 (Blackmun, J., dissenting).
on this trio of decisions. What matters for our purposes is that the canon on its face is indifferent to evidence of congressional intent as expressed in legislative history, and that a conservative majority has regularly relied on it to ignore—and effectively reject—such evidence. In addition to divided decisions invoking this canon, there are majority opinions that rely on other substantive canons in the face of legislative history indicating a settled congressional preference for a different result. We describe two of those opinions here.

In *Patterson v. McLean Credit Union*, 346 the Court addressed the meaning of a Civil War era civil rights statute, providing in relevant part that “[a]ll persons . . . shall have the same right to make and enforce contracts . . . as is enjoyed by white citizens.”347 Writing for five members, Justice Kennedy concluded that this provision, now codified at 42 U.S.C. § 1981, prohibits race discrimination only in the initial formation of an employment contract, not in the employer’s post-formation conduct.348 Accordingly, the majority held Patterson’s claim for racial harassment on the job to be non-actionable under § 1981.349 Justice Kennedy relied primarily on a plain meaning analysis, maintaining that the right to “enforce” an employment contract extends only to conduct by the employer that impairs an employee’s ability to enforce his established contract rights.350 Racial harassment on the job does not qualify as such an impairment; rather, it is “post-formation conduct . . . relating to the terms and conditions of continuing

345 See Gregory v. Ashcroft, supra, 501 U.S. at 477-78 (White, J., dissenting in part). See generally ESKRIDGE, FRICKEY & GARRETT, supra note 37, at 901-02; Colker & Brudney, supra note 124, at 134-36.
348 491 U.S. at 176-84.
349 Id. at 179. The Court in *Patterson* also reaffirmed § 1981’s basic applicability to private conduct, not merely contract formation involving governmental entities. That issue had been resolved in *Runyon v. McCrary*, 427 U.S. 160 (1976), but the Court had invited reconsideration after hearing oral argument on the racial harassment issue. *See Patterson*, 485 U.S. 617 (1988). The Court’s reaffirmation of its *Runyon* holding was unanimous.
350 491 U.S. at 177-78.
employment.”

The majority supplemented its literal meaning approach through reliance on the substantive presumption against a federal invasion of traditional state functions. Justice Kennedy noted that to allow § 1981 to cover racial harassment, even harassment triggering a constructive discharge, would in essence confer federal status on all state law claims for breach of contract that allege racial animus. Although he was prepared to do so if Congress had plainly directed such a result, Justice Kennedy invoked the rule that absent clear direction, “we should be and are ‘reluctant to federalize’ matters traditionally covered by state common law.”

In dissent, Justice Brennan criticized the majority’s “formalistic method of interpretation” as incompatible with specific evidence of congressional intent. He pointed to statements in the original legislative history to § 1981, indicating that Congress meant to encompass post-contractual conduct such as discriminatory punishment and abusive mistreatment on the job. Justice Brennan also relied on legislative history to Title VII, specifically the defeat of a 1972 amendment by Senator Hruska that was expressly intended to make Title VII the exclusive remedy for racially discriminatory treatment on the job. Congress debated and eventually rejected the Hruska amendment, after opponents stressed the importance of having the Civil War statute available as an alternative to race discrimination remedies under Title VII; Justice Brennan reasoned that this history confirmed Congress’s conscious commitment to preserving

356 Id. at 201-03.
the applicability of § 1981 for instances of on-the-job discrimination. \footnote{Id. at 203-04.}

There is a lot happening in the \textit{Patterson} opinions, including the Court’s unusual focus on reconsidering its own recent decision interpreting the scope of § 1981. \footnote{See \cref{n.349} supra.} From our vantage point, however, the by-now familiar tension involves a conservative majority relying on canons to help justify a willingness to ignore what the dissent contends are demonstrable congressional preferences regarding the very issue in dispute. \footnote{In addition to invoking the presumption against federalizing common law absent a clear congressional mandate, Justice Kennedy also contended that because Title VII already addressed racial harassment on the job and provided for conciliation prior to litigation, § 1981 should not be read to render Title VII’s “detailed procedures . . . a dead letter.” 532 U.S. at 181. Reliance on this maxim favoring inter-statutory harmonization again ignores the reality that Congress in 1972 had explicitly declined to make the provisions of Title VII exclusive.} Congress on this occasion promptly overrode the majority’s position as part of the 1991 Civil Rights Act, a statute that rejected an unusually large number of Court decisions construing Title VII and related anti-discrimination provisions. \footnote{See \textbf{Pub. L. No. 102-166, § 101} 105 Stat. 1071 (1991) (codified at 42 U.S.C. § 1981 (b)) (providing that “make and enforce contracts” covers all terms and conditions of employment). The 1991 Civil Rights Act wholly or partially overrode at least 12 decisions. \textit{See} William N. Eskridge, Jr., \textit{Overriding Supreme Court Statutory Interpretation Decisions}, 101 YALE L.J. 331, 333 n.4 (1991).} Still, the rapid and virtually unanimous repudiation by both Congress and a Republican President\footnote{See \textbf{136 CONG. REC. S. 16562} (Oct. 24, 1990) (Veto message from President Bush declaring that his 1990 civil rights bill would overrule Supreme Court’s interpretation of § 1981 in \textit{Patterson}; veto relates not to \textit{Patterson} but to other provisions of bill Congress approved); \textit{Id.} at S. 16565, 16571 (remarks of Sens. Hatch and Jeffords emphasizing broad consensus between President and Congress that \textit{Patterson} needs to be overruled).} cannot conceal the fact that a conservative majority used the canons to help justify its result in the face of considerable evidence that it was thwarting legislative intent.

Our final substantive canon decision, \textit{EEOC v. Arabian American Oil Co.}, \footnote{499 U.S. 244 (1991).} involves a dispute over the extraterritorial jurisdiction of Title VII. A United States citizen working in
Saudi Arabia for a U.S. company alleged that he was discriminatorily discharged.\textsuperscript{363} It was undisputed that Congress has constitutional authority to enforce its laws beyond U.S. territorial limits; the issue presented was whether Congress had exercised that authority in Title VII.\textsuperscript{364} Justice Rehnquist, on behalf of six members of the Court, concluded that Congress had not done so.\textsuperscript{365}

The majority relied primarily on the “longstanding principle of American law ‘that legislation of Congress, unless a contrary intent appears, is meant to apply only [domestically].’”\textsuperscript{366} Justice Rehnquist added that in applying this “rule of construction,” the Court would examine whether the \textit{language} of Title VII evidenced a congressional purpose to extend coverage abroad.\textsuperscript{367} Both the EEOC and the discharged employee pointed to two parts of Title VII as disclosing an intent to legislate extraterritorially. First, within the definitions section, an “employer” is covered if “engaged in an industry affecting commerce,” and “commerce” includes transactions “among the several states; or between a state and \textit{any place outside thereof}.”\textsuperscript{368} Second, a provision exempting aliens specifies that Title VII “shall not apply to an employer with respect to the employment of aliens outside any state,” and petitioners reasoned that unless the Act was meant to apply to \textit{citizens} extraterritorially, Congress would have had no rational basis for exempting the employment of \textit{aliens} abroad.\textsuperscript{369}

Justice Rehnquist did not reject these interpretations as untenable. Rather, he concluded

  \item \textsuperscript{364} \textit{Id.} at 248.
  \item \textsuperscript{365} \textit{Id.} at 248-60.
  \item \textsuperscript{366} \textit{Id.} at 248 (internal citation omitted).
  \item \textsuperscript{367} \textit{Ibid} (emphasis added).
  \item \textsuperscript{368} \textit{Id.} at 248-49, quoting 42 U.S.C. §§ 2000e(h), 2000e(g) (emphasis added).
\end{itemize}
that they were plausible but so were competing interpretations of the same language offered by the company.\footnote{Id. at 253-54, quoting 42 U.S.C. § 2000e-1.} Given that the text was therefore ambiguous, the majority concluded that petitioners had failed to overcome the presumption against extraterritorial jurisdiction by making the required “affirmative showing” of congressional intent.\footnote{Id. at 250, 255.}

In dissent, Justice Marshall took aim at what he deemed the majority’s misuse of the substantive canon. The presumption against extraterritoriality had not previously been applied as a “clear statement rule,” relieving a court of its obligation “to give effect to all available indicia of the legislative will.”\footnote{Id. at 260-61.} As a traditional canon of construction, the presumption should be rebuttable through evidence other than the text, notably legislative history.\footnote{Id. at 261-66, 278. Other relevant evidence of legislative intent was pertinent agency interpretations, which the dissent noted were also supportive of its position. Id. at 275-78.} While Justice Marshall disputed the majority’s view that the two key textual provisions were at all ambiguous,\footnote{Id. at 266-68.} he also relied heavily on the legislative history of the alien-exemption provision. The dissent quoted from both House and Senate committee reports, each of which described the exemption in terms reflecting a clear understanding that U.S. employers operating in foreign lands were within the purview of the Act.\footnote{Id. at 265-66, 278.}

The Rehnquist majority in \textit{Arabian American} is less dismissive and more deliberate than several other majority opinions we have discussed in this subpart. Nonetheless, the Court’s
methodological approach enables it to sidestep strong indicators that Congress meant to accomplish a very different result. By establishing this substantive canon as a barrier against considering the more ordinary indicia of legislative purpose, the Court effectively devalues “any genuine inquiry into the sources that reveal Congress’s actual intentions.”376 As so often happens in these contested decisions, the result is hostile to the assertedly protected interests of employees.

3. Ideological Ramifications

A recurring theme in this subset of divisive cases is the majority’s use of canons as an integral part of its determination to preclude all reference to legislative history. While the statutory text may favor the majority’s reading in some instances more than in others, that reading is never close to unequivocally correct. Given this reality, the role played by the canons is especially troubling. The legitimacy of language canons, and most substantive canons, derives in important respects from the judicial perception that language being interpreted is unclear, that additional interpretive resources are needed to help understand an inconclusive text.377 In these circumstances, one might expect the justices to consult both canons and legislative history, recognizing that all such interpretive aids are persuasive rather than conclusive.378

Yet the majority opinions discussed here assign the canons a more exalted status. They

375 Id. at 268-69 (quoting H.R. 88-570 and S. Rep. 88-867).

376 Id. at 278 (Marshall, dissenting). See also Shapiro, supra note 12, at 959 and n.195 (critical of majority reasoning). As with Patterson, the Court’s decision here was promptly overridden in the 1991 Civil Rights Act. See Pub. L. No. 102-166, supra note 387, at § 109.

377 See Circuit City, 532 U.S. at 138 (Souter dissent); Arabian American, 499 U.S. at 260-62 (Marshall dissent). Justice Marshall observes that clear statement rules may be an exception: they shield certain judicially articulated values more than “operat[ing] to reveal actual congressional intent.” Id. at 262.

are a resource that itself can justify ignoring potentially probative evidence of legislative intent. In the language canon cases, the majority uses canons “to establish that the text is so clear that legislative history is irrelevant.”  

In the substantive canon cases, the text’s lack of clarity triggers the majority’s adherence to a policy norm it has identified, again ignoring altogether the possibility that Congress has articulated relevant policy preferences through specific statements in the legislative record accompanying the text. In both instances, it is the canons—not the intrinsic clarity of the text—that justify principled indifference to legislative history, even though all of these justices recognize legislative history as probative in other settings.

This use of the canons to trump more “purposive” resources reflects a form of judicial activism that apparently need not be acknowledged, because it is couched in methodological terms. The fact that the majorities consistently favor employer interests over those of employees supports the pessimistic critique that the canons’ elevated role in these divided cases is fundamentally a façade to justify certain judicially devised policy preferences.

Admittedly, just as canon reliance is unidirectional, the legislative history in these contested cases is invariably cited to support liberal or pro-employee outcomes. This, however, should not be terribly surprising, given that the antidiscrimination and retirement-related statutes being construed are dedicated to serving employee interests. Since the 1960s, Congress has prescribed multiple layers of federal protections for workers as part of an effort to alter the employment-at-will status quo, thereby imposing a modestly redistributive regulatory matrix on

---

379 Circuit City, 532 U.S. at 138 n.2 (Souter dissent).

the American workplace. Evidence of specific legislative intent will tend to support this consistently liberal legislative objective.

There may, of course, be instances where Congress arranged a compromise, and legislative history helps explain the specific intent behind that compromise. That, indeed, was the kind of record evidence invoked by the Stevens dissent in Circuit City. More broadly, the Court’s frequent reliance on legislative history to support conservative results in our 632 case dataset—even in close decisions—indicates that evidence of negotiations or compromises protecting employer interests is also a staple of the legislative record. What remains distinctive about this group of cases is the majority’s unwillingness to contemplate, much less identify, such indicia of congressional intent. Instead, the majority in these cases regards legislative history as irrelevant, at least in part because of the role played by the canons. The Court thus uses interpretive techniques it promotes as neutral to help it achieve conservative results, ignoring substantial evidence that Congress had a very different purpose in mind.

C. Dueling Canons and the Legal Process Account

See notes 330-34 supra and accompanying text.

Overall, legislative history reliance is relatively neutral in ideological terms: it supports liberal decisions 49.8% and conservative decisions 43.2% of the time. Even in close cases, its invocation seems fairly even-handed: reliance accompanies liberal majorities 45.3% of the time and conservative majorities 46.9% of the time.

Justice Scalia in Mertens did tender a belated assertion about ERISA’s subsidiary purpose but this was conclusory and not supported. The other four cases simply regard legislative history as irrelevant because of role of canons.
perform important pragmatic functions furthering rule-of-law norms. As succinctly set forth by Eskridge and Frickey, the canons serve as “gap-filling rules” that help minimize judicial arbitrariness, thereby “rendering statutory interpretation more predictable, regular, and coherent.”

We have no wish to oversimplify these scholars’ positions: they assuredly do not celebrate the canons as interpretive bromides, and each cautions against mechanical application or undue reliance. Still, they share a perspective that use of the canons enhances consistency and predictability—regarding how the Court will treat certain word choices or syntactical configurations, and what it will presume about the allocation of power among different branches or levels of our constitutional structure.

Our results in Part III E provide some basis for questioning this optimistic perspective. Specifically, Table XII indicates that dissenting justices are significantly more likely to rely on language canons when language canons are also part of the majority’s reasoning, and are similarly inclined to invoke substantive canons when the majority too relies on such canons. These findings in turn suggest that in divided decisions, the justices themselves are more prone to view the canons as reasonably amenable to supporting either side.

Our previous case law discussion in this Part casts further doubt on the predictability hypothesis, at least with regard to language canons. In the Shell Oil decision, Justice Thomas for a unanimous majority acknowledged a credible conflict between two language canons often invoked by the Court. His reasoning, relying on the Whole Act Rule while rejecting the maxim that Congress uses the same term consistently across different statutes, is cogent but not

386 Id. at 66-67.
387 See, e.g., SUNSTEIN at 151, Shapiro at 958-59, Eskridge & Frickey at 66.
irresistible. Given the number of statutes in which Congress has identified both employees and
former employees as objects of its attention, a determination that this provision’s reference to
“employees or applicants” actually excluded former employees would also have been
defensible.\footnote{Such defensibility is strengthened by the majority’s candid acknowledgement that the Court had recently
construed “employees” in a basic definitional section of Title VII as covering only current employees. See note 284 \textit{supra}.} In the end, the majority opinion derives some of its persuasiveness from the
purposive argument that Justice Thomas withholds until the final paragraphs of his analysis.

A comparative glance at other cases discussed earlier invites similar reservations. The
Court in \textit{Coutu} and \textit{Barrett} relied on the \textit{expressio unius} canon—once to help foreclose and once
to help preserve a private right of action.\footnote{See text accompanying notes 234-36 and 241-43 \textit{supra}.} To be sure, the majority in \textit{Coutu} had reasoned that
it would not inferentially expand a right of action clause which it viewed as already limited in
scope, whereas the majority in \textit{Barrett} reasoned that it would not by implication constrain a right
of action provision which it characterized as unconditional. Yet even these characterizations
might be fairly contestable in linguistic terms. In \textit{Barrett}, for instance, the employer and its
supporting \textit{amici} essentially invoked the Whole Act Rule, contending that the AWPA right of
action had to be limited in order to allow another important provision in the Act to retain its
coherence by avoiding implied preemption of well-settled state law on workers’
compensation.\footnote{See Brief for Petitioner, Adams Fruit Co., at 15-17 (No. 88-2035); Brief for \textit{Amici Curiae} American Farm Bureau
Federation et al., at 18-19, 21-22 (No. 88-2035).} And while the majority in \textit{Barrett} expressly declined to impose such a
restriction based on the meaning of an entirely separate section of the statutory scheme, the
majority in \textit{Sutton} invoked the Whole Act Rule as its justification for imposing precisely that

\footnote{See notes 258-263 and accompanying text.}
\footnote{See notes 234-36 and 241-43 \textit{supra}.}
kind of restriction.\textsuperscript{392}

Stepping back, it is notable that certain language canons regularly relied on in majority opinions are also frequently promoted by dissenters in those same cases without success.\textsuperscript{393} There are at least a dozen dissents invoking the Whole Act Rule to help challenge majority reasoning that itself uses one or more canons to justify the Court’s holding. Such competitive reasoning does not signify that the meaning of these canons is hopelessly relative. It does, however, suggest that decisions about when and how to use the language canons hinge on case-specific and justice-specific considerations more than the intrinsically foreseeable logic of the canons themselves. In short, reliance on the canons may be justified as situationally enlightening without in any meaningful sense promoting a more systemic predictability or consistency.

The fact remains that in our dataset, the decisions featuring dueling canons are for the most part ideologically conservative. This result-oriented trend could qualify as a certain kind of predictability. Professor Shapiro has observed that the canons tend to favor continuity over change by promoting cautious interpretations of inconclusive text so as to minimize inadvertent sacrifices of the status quo.\textsuperscript{394} Shapiro makes clear that he does not advocate reliance on canons when there is “sufficient evidence of legislative purpose” that change was intended.\textsuperscript{395} The canons, however, may be operating—especially in the Rehnquist era—to make it harder for such evidence to be deemed “sufficient.”

\textsuperscript{392} Compare 494 U.S. at 644-45 (Barrett) with 527 U.S. at 487 (Sutton).

\textsuperscript{394} Shapiro, supra note 12, at 927-41.

\textsuperscript{395} Id. at 945.
We have already discussed an important set of cases in which language or substantive canons were used to preclude consideration of clear and uncontroverted evidence in the legislative record. A number of those decisions also feature dissents relying on canons that would support a more purposive interpretation of text. Thus, for instance, Justice Souter in Circuit City invokes the Whole Act Rule, insisting that the exemption for employment contracts must be treated “as keeping pace with the expanded understanding of the commerce power generally” in order to make the FAA “coherent . . . as a whole.” 396 Similarly, Justice Stevens in Sutton urges reliance on the substantive canon that the ADA should be construed broadly to effectuate its remedial purposes, 397 while Justice Marshall in Arabian American contends that under a proper understanding of the canon disfavoring extra-territorial jurisdiction, Congress in its Title VII legislative record overcame the presumption. 398 In these cases, and others, 399 the Court’s majority ignored or rejected pleas from colleagues to rely on canons that supported legislative change. Still, while such cases may illustrate a recent trend toward ideological conservatism in the competitive use of the canons, they do not suggest the presence of any larger methodological consistency in the way the canons are likely to operate.

Two additional case law examples further address this concern regarding potential indeterminacy in canon usage. In Mackey v. Lanier Collection Agency, 400 a 1988 decision, the

396 Circuit City, 532 U.S. at 137.
397 Sutton, 527 U.S. at 504.
398 Arabian American, 499 U.S. at 262-66.
issue dividing the Court was the impact of ERISA’s basic preemption clause on a general state garnishment law that applied *inter alia* to allow collection from welfare benefit plans after monetary judgments had been obtained against some fund beneficiaries.\(^{401}\) Section 514(a) of ERISA preempts “any and all State laws insofar as they may now or hereafter *relate to any* employee benefit plan” covered by the Act.\(^{402}\) Georgia’s general garnishment provision makes no specific reference to ERISA plans of any kind. Writing for five members of the Court, Justice White held that the federal preemption language did not bar applicability of the state law, thus allowing the execution of judgments against ERISA welfare benefit plans.\(^{403}\)

The majority opinion relied in important respects on the Whole Act Rule.\(^{404}\) Justice White noted that another provision of ERISA, § 206(d)(1), explicitly barred the assignment or alienation of pension plan benefits, thus prohibiting the use of state enforcement mechanisms that would prevent *pension benefits* from being paid to pension plan recipients.\(^{405}\) In the majority’s view, if § 514(a) were construed to bar garnishment of *all* ERISA plan benefits (i.e., affecting welfare benefits as well as pension benefits, and affecting plans as a whole, not just direct benefit payments) there would have been no need for § 206(d)(1). The majority declined “to adopt an interpretation of a congressional enactment which renders superfluous another

\(^{401}\) *Id.* at 830-31. The Court was unanimous in its view that state law specifically regulating ERISA funds was preempted, but it split 5-4 on this general garnishment law that made no reference to ERISA.

\(^{403}\) *486 U.S.* at 830-841. The lineup of justices writing opinions was somewhat unusual, in that Justice White favored limited preemption of state law while Justice Kennedy in dissent argued for a broad federal preemptive scope. Justice White was joined by Justices Rehnquist, Brennan, Marshall, and Stevens, while Justices Blackmun, O’Connor, and Scalia joined Justice Kennedy in dissent.

\(^{404}\) Justice White also invoked text, legislative purpose, legislative inaction, and Supreme Court precedent as part of his reasoning.

\(^{405}\) *486 U.S.* at 836 (discussing *29 U.S.C.* § 1056(d)(1) (2000)).
portion of the same law.”

In dissent, Justice Kennedy acknowledged the force of the Whole Act Rule, but contended that it actually cut in his favor. Pointing to yet another ERISA provision, Justice Kennedy observed that Congress in 1984 had added language to § 514 explicitly exempting certain domestic relations orders from the preemptive scope of ERISA. Accordingly, the dissent reasoned, by preserving only a limited class of state garnishment orders, under specifically prescribed conditions, this new § 514(b)(7) makes clear that § 514(a) otherwise applies broadly to preempt the type of general garnishment statute before the Court. To Justice Kennedy, the majority’s reading rendered § 514(b)(7) totally redundant, and “it is preferable, in my view, to tolerate the partial overlap [with § 206(d)(1)] rejected by the Court than to construe § 514(a) so as to render another section of the statute surplus in its entirety.”

In a statute as “comprehensive and reticulated” as ERISA, it is perhaps less than remarkable that both sides could find a plausible reference point from which to identify superfluous structural consequences if the imprecise language at issue were construed against their position. Further, both opinions in Mackey marshaled other interpretive resources as part of their reasoning, and one would be hard-pressed to conclude that either side’s application of the Whole Act Rule was “more persuasive”—within the Court or even in a larger context. Yet as

411 Although the United States was not a party, it filed an amicus brief and argued before the Court that § 514(b)(7) clarified the broad impact of § 514(a). See Brief for the United States as Amicus Curiae Supporting Petrs, at 6, 21,
we have previously observed, it is in complex and technical areas that the Court is often more
inclined to invoke structural canons like the Whole Act Rule. The Mackey decision is an apt
illustration of how the justices can reasonably and self-consciously disagree regarding the
applicability of such a canon in a particular case.

In our final case law example, Lehman v. Nakshian, the Court in 1981 had to decide
whether the 1974 ADEA amendments extending coverage to the federal government conferred
the right to a trial by jury when federal employees sue their employer. Justice Stewart, writing
for five members, held that there was no right to a jury trial in the statute. Both language
canons and substantive canons figured prominently in his reasoning.

The case revolved around the relationship between two remedial provisions of the
ADEA: § 7(c), covering actions brought against private employers and state or local
governments, and § 15(c) covering actions brought against the federal government. Section
7(c)(1) authorized aggrieved persons to seek “legal or equitable relief,” language identical to
what appears in § 15(c). However, § 7(c)(2), explicitly conferring the right to a jury trial, had no
analog in § 15. Justice Stewart invoked the expressio unius canon: Congress knew exactly how
to provide for the right to a jury trial, and its failure to do so in § 15 was highly probative. He
also relied on the in pari materia canon, reasoning that because Congress had patterned its
overall § 15 enforcement scheme after the comparable provisions for federal employees under
Title VII, and Congress in the Title VII provisions clearly provided no right to jury trials, it

414 See 20 U.S.C. §§ 626(c), 633a(c).

415 453 U.S. at 162-63.
followed that no right to a jury trial should be inferred here.\textsuperscript{416} Although Justice Stewart maintained that in light of the majority’s linguistic analysis it was unnecessary to consult legislative history, he did in fact explore that history and concluded that it too supported the majority’s position.\textsuperscript{417}

In dissent, Justice Brennan relied on the \textit{in pari materia} canon to draw very different conclusions. Pointing to the identical “legal or equitable relief” language of § 7(c)(1) and § 15(c), Brennan maintained that Congress had patterned the precise federal employee provision at issue after its previously-enacted private employee section, and the Court should therefore interpret them similarly.\textsuperscript{418} Because the Court three years earlier in \textit{Lorillard v. Pons}\textsuperscript{419} had held that the text of § 7(c)(1) conferred a right to jury trial, it seemed clear to Brennan that the same text must yield the same result here.\textsuperscript{420} From the dissent’s standpoint, § 7(c)(2) was essentially a red herring. It had been introduced while \textit{Lorillard} was pending before the Supreme Court, in order to settle the circuit court conflict over the meaning of “legal and equitable relief” in what was then simply § 7(c). Once \textit{Lorillard} was decided, the enactment of § 7(c)(2) in essence codified the Court’s holding, a codification that did not detract from the dissent’s canon-based analysis.\textsuperscript{421}

The majority had one last canon to invoke in its favor. Justice Stewart observed that even if his linguistic and structural arguments and his reliance on legislative history were not

\textsuperscript{416} \textit{Id.} at 163-64. The \textit{in pari materia} canon calls for similar statutes to be interpreted similarly. \textit{See} ESKRIDGE, FRICKY & GARRETT, \textit{supra} note 37, at Appendix B.

\textsuperscript{417} \textit{Id} at 165-68. The majority’s willingness to consider legislative history as possibly rebutting its canon-based reasoning reflects a very different methodological approach from that taken in later years. \textit{See} Part IV B, \textit{supra}.

\textsuperscript{418} 453 U.S. at 177-78.

\textsuperscript{419} 434 U.S. 575 (1978).

\textsuperscript{420} 453 U.S. at 173-74.
dispositive, the presumption against a waiver of federal sovereign immunity dictated the Court’s ruling. The sovereign immunity of the United States applies to the terms and conditions under which the government consents to be sued; accordingly, continued the majority, Congress’s failure to express unequivocally in text its willingness to be subject to jury trials meant that federal employees have not been granted such a right.\textsuperscript{422} Justice Brennan countered that the unequivocally expressed waiver of sovereign immunity contained in § 15 was itself sufficient to cover jury trials; if anything, Congress’s history of stating explicitly that no jury trial was available in a range of statutes authorizing suits against the federal government established that the sovereign immunity canon did not include a presumption against the right to a jury trial.\textsuperscript{423}

In contrast to \textit{Mackey}, \textit{Lehman} is a decision involving multiple canons. As with \textit{Mackey}, though, it is not obvious that one side’s use of canons is more convincing than the other’s. The \textit{in pari materia} canon points in two plausible directions in part because the ADEA is a hybrid statute. Congress over the years has borrowed specific language and general concepts from multiple sources, and reasonable disagreements arise as to which “other law” is deemed the appropriate pattern-setter. The clash over the sovereign immunity canon reflects a dispute regarding outer contours rather than core applicability. Here, too, one can expect disagreements given the complex body of Supreme Court precedent construing the sovereign immunity canon and the varied textual circumstances in which Congress has chosen to expose the government to lawsuits.

It should be apparent that we have been examining some “harder cases” in this subpart. When the justices are unanimous in their application of a specific canon, or when they view the

\textsuperscript{421} \textit{Id.} at 178-80.
\textsuperscript{422} \textit{Id.} at 160-61, 168-69.
canons as pointing in only one direction, these maxims of construction will appear to enhance predictability, as do other interpretive resources relied upon without contradiction. It is the harder cases, however—those in which competing or even identical maxims support reasonable disagreements—that counsel against making extravagant claims regarding the canons’ capacity to enhance consistency in judicial decisionmaking.

D. Emerging Lessons

One argument regularly advanced in recent years to support the rationality and legitimacy of the canons is that they function as a kind of ordering mechanism, a set of often-invoked interpretive aids which Congress can and should anticipate when drafting, in order to enhance its lawmaking prowess. As a descriptive matter, a recent case study of congressional drafting techniques seriously questions whether Congress can realistically empower the canons to perform such a role. Professors Victoria Nourse and Jane Schacter interviewed a bipartisan group of 16 Senate Judiciary Committee staffers (all attorneys) as well as lawyers from the Senate’s Legislative Counsel Office. They found that counsel involved in drafting are generally aware of the canons but that these rules and presumptions are not an important factor as statutory language is written or debated. Legislative drafting is a highly contextual and intensely pressured process, and generalized rules of construction can not be readily integrated

423 Id. at 170-71.
424 See SUNSTEIN, supra note 20, at 154 (discussing canons’ function to improve lawmaking); Eskridge & Frickey, supra note 12, at 66-67 (discussing canons’ role as signaling devices to legislative drafters, enabling them to lower costs of drafting statutes).
426 Id. at 600-04.
into that process.\footnote{See id. at 590-97 (describing legislative drafting process as perceived by key staffers). See also James J. Brudney, 
Congressional Commentary on Judicial Interpretations of Statutes: Idle Chatter or Telling Response?, 93 Mich. L. Rev. 1, 16-17, 21-26 (discussing fractured and politically sensitive nature of lawmaking process in Congress).} Further, because drafting is focused on securing collective action through negotiated agreement, often involving a shifting coalition of both invited and late-arriving players, the canons’ putative virtues—promotion of clarity and predictability—are not as highly valued by lawmakers as they are by many judges.\footnote{See Nourse & Schacter at 594-600, 614-16.}

It is possible that the Nourse and Schacter study tells only part of the story about how Congress actually performs—or is capable of performing—as a lawmaking enterprise. But even assuming \textit{arguendo} that Congress is more educable than Professors Nourse and Schacter contend, our findings and analyses raise considerable doubt as to why lawmakers \textit{should} look to the canons for guidance on any systemic basis. What emerges from our empirical and doctrinal review suggests that the canons are being overvalued, in terms of their ability to promote either predictability or impartiality in judicial reasoning.

1. From the standpoint of predictability, we reported that when the majority relies on language canons or substantive canons in non-unanimous opinions, the dissent is significantly more likely to invoke that same type of canon as well. An important implication of this finding is that the justices regularly are prepared to argue that the canons do \textit{not} produce clarity, by applying them in ways that are incompatible, if not inconsistent, when competing to advance principled justifications.

   Our discussion of individual cases illuminates how certain key language canons lend themselves to such malleable uses. The Whole Act Rule rests on a presumption that statutes should be understood, whenever possible, to be structurally coherent and to contain no surplus
phrases or provisions. Yet Congress’s complex statutory schemes regulating the workplace—
ERISA, Title VII, the ADEA, and others—typically reflect an accretion of multiple enactments,
addressing both discrete and overlapping issues over a period of years if not decades. Such
lawmaking histories tend to produce linguistic residues, redactions, and repetitions. Under these
circumstances, it is not surprising that thoughtful justices, supplemented by arguments from able
counsel, will often reach conflicting understandings derived from considerations of structural
integrity or coherence. The disagreement in *Mackey* was a classic example of this conflict
involving the Whole Act Rule alone. And presumptions based on structural coherence become
even more susceptible to principled disagreement when the Court also addresses the possibility
of consistent usage across distinct regulatory schemes.429

The *expressio unius* canon similarly generates a likelihood of reasonable divergent
applications.430 Two presumptions about law-writing techniques underlie this canon: that
legislative drafters do not use excessive or dispensable language, and that they do use particular
words or phrases in different parts of a single statutory scheme to convey the same meaning.431
Once again, our cases demonstrate how these beguiling presumptions minimize the very real

429 Majority opinions in *Lehman*, *Mertens*, and other cases have invoked this broader vision of harmonious drafting
to help explain why a phrase in one statute should be construed to have the same meaning as it had been given in a
different area of workplace law. At the same time, the dissent in *Lehman*, and a unanimous majority in *Robinson*,
illustrate the tensions that so often arise between reliance on such interstatutory comparisons and claims based on
structural coherence within a single statutory scheme. See generally Buzbee, supra note 259, at 234 (critical of
counterfactual assumptions about omniscient legislators in drafting process). Professor Buzbee contends that intra-
statutory linguistic comparisons such as *expressio unius* rest on more defensible aspirational assumptions about
thoroughness in drafting consideration, because there is an enacting coalition that is aware of which provisions will
share space within a single statute, *id*. at 225-28. But the concept of a single Title VII statute, or a single ERISA
statute, is itself suspect given the succession of revisions, modifications, and additions that are crafted by a series of
distinct enacting coalitions over a period of many years.

430 See, e.g., Christensen v. Harris County, 529 U.S. 576, 583-84, 593-94 (2000) (majority and dissent squarely
debate applicability of *expressio unius* to a provision of Fair Labor Standards Act); John Hancock Life Ins. v. Harris
Trust & Savings Bank, 510 U.S. 86, 96-97, 112-13 (1993) (majority and dissent disagree on applicability of
*expressio unius* approach to text of ERISA).
prospects for principled disagreement. The sharp division in Circuit City over the meaning of “commerce” in two different sections of the FAA pertained importantly to whether the different words modifying “commerce” were probative or essentially superfluous. And the Court’s candid discussion in Robinson recognized that despite a specific Title VII definition of the word “employee,” the term has two quite different connotations as used in different parts of that Act.

It also is worth recalling that overall language canon reliance in majority opinions by both conservative justices and liberal justices has produced results remarkably consistent with their respective ideological preferences.432 We believe this finding further supports our conclusion that the language canons cannot serve as a source of systemic interpretive guidance for lawmakers. We do not mean to suggest that the justices apply these canons in a manner that is disingenuous or unprincipled. Rather, it is precisely because the language canons are so adaptable in their application that they can be, and have been, invoked to help justify positions that have deeper ideological or policy-related foundations.

The substantive canons at first glance appear more promising as a set of signals to congressional drafters. Because these canons tend to set forth judicial policy norms or preferences, they could be viewed as more predictably instructive. While certain substantive canons are relatively open-ended in policy terms,433 others relied on by the Court seem to convey a more precise prescriptive message. Since the 1980s, for instance, the Court has regularly held that Congress must speak in unequivocally clear terms if it means to abrogate the states’

432 See Table X and accompanying discussion supra.
433 The canon of avoiding constitutional issues and the presumption against repeals by implication offer only vague guidance to Congress: it is more difficult to anticipate, much less avoid, constitutional problems that may arise in the future, and similarly challenging to anticipate how current language may be construed in light of potentially affected provisions from earlier statutes often dispersed through the U.S. Code.
Eleventh Amendment immunity. Over a longer period, the Court has declared that Congress must be reasonably clear if it wishes to assert extraterritorial jurisdiction, to interfere with traditional or historic state functions, or to waive the immunity of the federal government including the particular conditions under which the government consents to be sued.434

Still, one concern raised by these policy-based maxims is just how much weight to accord them. In promoting particular substantive values, the canons may function as virtually irrebuttable clear statement rules or as mere tiebreakers, but most often they operate as presumptions that can be overcome by the cogent force of other interpretive resources.435 Assessing the persuasiveness of such other resources—plain meaning, legislative history or purpose, Supreme Court or common law precedent—allows for considerable discretion and, hence, uncertainty as to the probative impact of the substantive canon. The Court’s ERISA decisions invoking the general anti-preemption presumption are illustrative in this regard. Over the past 15 years, the presumption has been relied on in numerous cases to help justify restricting the scope of ERISA,436 and has been distinguished or disregarded in a comparable number of other cases that have imposed ERISA preemption.437 Similarly, with respect to the presumption against extraterritorial jurisdiction, the justices’ heated disagreement in the Arabian American Oil case438 reflects divergent understandings both as to how much weight the presumption should

434 See notes 58-59 supra and 366-371 supra, and accompanying text.
435 See ESKRIDGE, FRICKEY, & GARRETT, supra note 37, at 851; POPKIN, supra note 121 at 201.
receive and as to how consistently the Court has applied it over the years.\footnote{Compare 499 U.S. at 248-49 (majority opinion) with id. at 260-66 (dissenting opinion).}

Apart from the need to reconcile judicial policy norms with an array of competing interpretive resources through case-by-case analysis, there is an additional concern about the Court’s ability to furnish interpretive guidance through its choice of substantive canons. It is far from clear that an enacting Congress can reasonably anticipate future cycles of Supreme Court preference for particular policy norms. Typically, the Court does not thoroughly engage the major aspects of a new congressional regulatory scheme until a decade or more has passed following enactment. Accordingly, there is the risk that legislators who debate and approve that scheme simply can not foresee how the Court’s substantive canon priorities are likely to evolve in the longer-term. During the 1960s and 1970s, when most of the major workplace-related statutes being litigated today were enacted,\footnote{See, e.g., Equal Pay Act of 1963, Title VII of 1964 Civil Rights Act (extended to federal employees in 1972), ADEA of 1967 (extended to federal employees in 1974), Occupational Safety and Health Act of 1970, Federal Coal Mine Safety and Health Act of 1969, ERISA in 1974.} the reigning interpretive presumptions favored broad deference to congressional judgment in the exercise of its Article I and Fourteenth Amendment powers,\footnote{See generally Robert C. Post & Reva B. Siegel, \textit{Equal Protection By Law: Federal Antidiscrimination Legislation After Morrison and Kimel}, 110 YALE L.J. 441, 447-48, 487-89, 494-95 (2000); Colker & Brudney, \textit{supra} note 124, at 89-94.} and respect for Congress’s purposive remedial efforts in general.\footnote{One could argue that based on current preferred substantive canons, Congress today should take pains to insert explicitly into text every conceivable manifestation or extension of its legislative authority. Alternatively, the current Congress might try to tailor its drafting technique}
to what it can plausibly expect will be the Court’s next set of elevated policy-based presumptions or “dice-loading rules.”

The latter approach would, of course, tend to vitiate further the predictive value of the substantive canons. Still, given the unusually public tensions within this Court regarding the proper distribution of sovereign authority between Congress and the states, it may well be that a suitably educated Congress should anticipate a re-ordering of at least some current judicial policy preferences.

In sum, we have shown how, for somewhat different reasons, neither the language canons nor the substantive canons can be counted on to generate consistent, objective guidance regarding the interpretation of workplace law statutes. Our explanation for this shortfall goes beyond Llewellyn’s assertion of radical indeterminacy based simply on the presence of a countercanon for every canon. The systemic indeterminacy we have described is attributable to a confluence of factors. Language canons that contemplate the structural integrity of the law often invite principled disparate applications. Key substantive canons are assigned varying weights in different case-specific circumstances. Most important, the multilayered and detailed arrangement of our basic regulatory schemes typically allows for several canons to be arrayed on each side of a contested case. These factors combine to assure the exercise of considerable judicial discretion when applying the canons. Such discretion is an important component of the Court’s decisionmaking process, but it does undermine claims that reliance on the canons

443 Scalia, supra note 14, at 28.

444 See Kimel v. Fla. Bd. of Regents, 528 U.S. 62, 97-98 (2000) (dissenting opinion) (asserting that four justices do not recognize stare decisis on Court’s Eleventh Amendment decisions and implying they will overrule these decisions as soon as practicable); Nevada Dep’t of Human Resources v. Hibbs, 123 S. Ct. 1972, 1984-85 (2003) (concurring opinions) (reaffirming this position on behalf of same four justices).

445 See Llewellyn, supra note 24, at 401-06.
somehow makes judicial reasoning as to the meaning of legislation more predictable or consistent.

2. With respect to the goal of impartiality, it is ironic that the most strikingly consistent finding from our study may well be the ideologically-colored tension on the Rehnquist Court between majority invocation of canons and dissent reliance on legislative history. We expected to observe some wariness about legislative history within canon-dependent majority opinions, given the broader pattern of diminished reliance on such legislative materials and the particular skepticism expressed by public choice scholars and some current justices as to the underlying value of “congressional intent” evidence.\(^{446}\) What we discovered from our subset of majority opinions, however, is much less neutral than generalized wariness.

In their revived status, the canons have been hailed as shared conventions that can help interpreters to decode ambiguous or inconclusive texts.\(^{447}\) Intentionalist evidence, derived from legislative history, has been promoted over the years as serving a similar function with the added value of possessing a democratic pedigree.\(^{448}\) To the extent that intentionalist efforts at decoding are now deemed more vulnerable to error, a pragmatic interpreter might well try to reconcile the two resources by discounting the weight accorded to record evidence in the face of persuasive canon-based reasoning. The Court in the cases we analyzed went further—it relied on the canons to preclude any weighing of legislative history at all.\(^{449}\) That interpretive move would

\(^{446}\) See n.122 and accompanying text \textit{supra}.

\(^{447}\) See Manning, \textit{supra} note 11, at 291-92.

\(^{448}\) See \textit{id.} at 288-89.

\(^{449}\) We discussed 10 such cases in the text and footnotes of Part IV B \textit{supra}. While we focused on decisions and reasoning we found especially revealing, we also noted that the tension between canons and legislative history extends beyond these 10 cases. \textit{See}, e.g., Library of Congress v. Shaw, 478 U.S. 310 (1986); Norfolk & Western Ry. v. Am. Train Dispatchers Ass’n, 499 U.S. 117 (1991); Estate of Cowart v. Nicklos Drilling, 505 U.S. 69 (1992);
likely be criticized as anti-legislative, at least from within the intentionalist camp.

Such criticism, however, should carry comparatively little methodological bite for canon supporters, so long as the results of the majority’s preclusive reasoning seem to reflect disinterested and impartial analysis. It is not hard to imagine a subset of decisions in which the ignored or excluded legislative record evidence in numerous instances supported the employee’s legal position while on many other occasions favoring the employer’s.\footnote{Insofar as the canons are being used objectively to discredit reliance on legislative history, one would expect the consequences of such discrediting to be relatively content-neutral.} Justice Scalia has aptly observed that the canons are meant to be persuasive, not conclusive. In responding to persistent concerns about their thrust-and-parry imprecision, he has defended their role as one among many interpretive resources that help courts to provide uniform and objective answers regarding the reasonable meaning of statutes.\footnote{While the Court’s answers in this group of decisions is very close to uniform, the outcomes reached are harder to justify as objective. It is difficult to escape the conclusion that the language canons and substantive canons in such cases are functioning more as a façade to promote judicial policy preferences than as a principled methodological tool.} To be sure, the subset of cases that exemplifies instrumental use to serve policy-related ends is just that, a subset. Our larger collection of majority opinions reflects that the canons assist in the performance of valued interpretive functions. As rules of thumb addressing

\begin{footnotesize}
\footnote{Raygor v. Regents of Univ. of Minn. 534 U.S. 533 (2002). \textit{See also} note 274 \textit{supra} (discussing seven additional cases in which language canon dissents clash with reliance on legislative history by liberal majority).}
\footnote{\textit{See} note 384, \textit{supra}, (reporting that legislative history reliance supports an equal share of liberal and conservative results in close cases, and overall).}
\end{footnotesize}
how certain words or phrases often interrelate, or how a hypothetical legislature might expect its authority to be reconciled with that of other lawmaking entities, the canons “help uncover competing interpretive possibilities.”\textsuperscript{452} When these rules of thumb are understood as presumptive rather than conclusive, they are subject to being questioned, challenged, or distinguished in light of other interpretive factors.\textsuperscript{453}

Such reflective and ongoing conversation within judicial opinions deepens the interpretive inquiry, by effectively encouraging courts to consider additional sources of legislative meaning, and even to appreciate how the rules of thumb themselves often point persuasively in divergent directions.\textsuperscript{454} Some of the decisions we examined used canons to recognize and respond to arguments raised by dissenting justices or non-prevailing parties. Other decisions relied on canons to help explain and justify a result which, although unanimous, was not therefore free from doubt.

In performing these functions, the canons can provide shape and promote coherence for individual majority opinions, which over time helps to build professional and public respect for the body of work generated by the Court. Of course, other interpretive resources contribute in precisely the same way to constructing the Court’s case-by-case reputation for rational, principled decisionmaking. Indeed by invoking a range of resources in virtually every majority opinion—textual and contextual, historically-based and contemporary, descriptive and

\textsuperscript{451} SCALIA, supra note 14, at 27-28. As we noted earlier, Justice Scalia’s justification here is for language canons, rather than substantive canons, although he specifically includes “clear statement” protection for state sovereign immunity as a common sense norm more than a substantive canon. \textit{Id.} at 29.

\textsuperscript{452} Graham, supra note 431, at 68.

normative—the Court invites the legal profession to anticipate, and strive for, an approach to judicial reasoning that is cautious, deliberative, and objective.

Like any interpretive resource, however, the canons carry both inherent limitations and risks of misuse. The risks have become more serious in recent times, given the normative claims for special status that have been advanced on the canons’ behalf. It is possible that the theorized accounts celebrating predictability or neutrality are influenced to some extent by a perceived distinction between law and politics. Disputes over the meaning of abstract Latin phrases, or freestanding policy maxims, may seem relatively respectable and law-like not only to scholars but to judges and the attorneys who appear before them. These arguments may be contrasted, even if subconsciously, with messier, more politically tinged disagreements as to the implications of committee reports or floor statements. The presence of such subtle favoritism for “law-based” argumentation may in part reflect an understandable impulse to defend the legitimacy of judicial reasoning in a vulnerable, “politicized” era.

Still, our findings and analyses suggest that the canons—at least as applied by the Supreme Court in this area of law—are not entitled to this added measure of respect. Once we see in detail how readily canons can be used to defend contradictory results, and how they have been used to promote judicial policy preferences at the expense of evident congressional intent, it becomes problematic to view them as systemically contributing to a consistent or impartial methodology of interpreting statutes. The decisions in our dataset, aggregatively and individually, demonstrate these limitations and pitfalls, while also providing some reassurance about the case-specific value that canons bring to the interpretive enterprise.

454 See Graham, supra note 431, at 68 (discussing benefits of maxims).
The issues we set out to explore are not new. Sixty years ago, Justice Jackson, confronted with plausibly competing canon-based arguments, wondered out loud ‘what’s a judge to do’? More recently, scholars and judges have advanced a range of descriptive and normative models to explain or justify how the canons operate. While the role of this interpretive resource has been heavily theorized, it has also been underexplored from an empirical standpoint. Our effort to demonstrate the complexity and variability of canon applications is a first step toward redressing that imbalance.

The canons are distinctly more popular with the Supreme Court today than they were a generation ago. Part of that popularity includes a certain elevation in their status above other interpretive resources, at least for some members of the Court. Yet, as we have shown, language canons turn out to be remarkably adaptable when applied to the comprehensive, complex, and often confusing regulatory schemes that define our statutory landscape. Accordingly, it is a mistake to expect that canons like expressio unius, in pari materia, or the Whole Act Rule can provide predictable guidance or enhance the clarity of statutory interpretation in any larger sense. If anything, the malleability of these language canons, and the uncertain weight and cyclical fashionability of certain substantive canons, should serve as a warning against unduly ambitious claims on their behalf.

As our study also indicates, the canons in recent times have been applied in ideologically slanted ways that are hostile to considerations of legislative purpose or intent. That, too, is a

---

dimension of canon usage on which Justice Jackson offers some historical perspective. There are deep-seated tensions between the canons and legislative history, on this Court as in earlier times. In a subsequent article, we hope to examine in comparable depth the Court’s use of legislative history as a resource during the extended period of our dataset.

In the end, the canons are only one of many interpretive tools available to judges engaged in the deliberative process. Whether they serve as a form of neutral reasoning depends both on how they are used in a range of settings and on how they are understood to have been applied by the Court’s various audiences—lower courts, lawyers, scholars, and the attentive segments of the public. Our showing, that the Court’s reliance on canon-based reasoning can seem objective and self-evident under one set of conditions, unpredictable and inconsistent in a second setting, and strategic or ideologically driven in a third, offers a cautionary message for proponents of any particular approach to judicial reasoning. The canons are to be appreciated as an interpretive resource, not esteemed as a first among equals.

See id. at 350 and n.7 (observing that the preface to Sutherland’s first edition on statutory construction, published in 1890, scorned the legislative enterprise as interfering with the law’s ‘process of . . . intelligent judicial administration,’ and noting the modest progress made by the third edition (published in 1943) which “reflect[ed] the growing acceptance of statutes as a creative element in the law rather than . . . as ‘legislative interference’”) (internal citations omitted).
Appendix: Differing Types of Reliance on Language Canons

In Barnhart v. Sigmon Coal Co., Inc., the Court held that under the Coal Industry Retiree Health Benefit Act of 1992 (Coal Act), the Commissioner of Social Security was barred from assigning retired miners to the direct successors in interest of out-of-business coal mine operators. Writing for six members of the Court, Justice Thomas concluded that the Coal Act unambiguously prohibited the assignment of responsibility for insurance premiums that the Commissioner had made. Justice Thomas relied primarily on the statutory language itself; the Act listed three categories of “related person” to which the disputed retirees could be assigned, and this successor corporation did not fall into any of those categories.

Justice Thomas then relied on the expressio unius canon for additional support. He noted that because Congress had explicitly provided for successor liability in two other sections of the Coal Act, neither of which applied to this factual setting, Congress’s failure to do so in the section being litigated precluded any inference of liability. The Commissioner and the dissenting justices relied on floor statements from two key Senate sponsors stating the Senators’ understanding that the definition of “related person” was meant to be broad enough to encompass successors like the one in Barnhart. The Commissioner and the dissenters also contended that a less literal reading of “related person” would support Congress’s underlying purpose of identifying those persons (such as direct successors to a collective bargaining agreement) most responsible for plan liabilities. Justice Thomas considered these legislative history and purpose arguments, but found them unavailing in the face of clear statutory text.

In Director, OWCP v. Newport News Shipbuilding & Dry Dock Co., the Court unanimously ruled that the Director of the Office of Workers’ Compensation Programs (OWCP) in the Department of Labor lacked standing to appeal a decision by the Department’s Benefits Review Board (BRB) which was adverse to an injured employee claimant. The claim arose under the Longshoremen and Harborworkers Compensation Act (LHWCA), and the Secretary of Labor had delegated all administrative responsibilities under that Act to OWCP. Writing for eight members, Justice Scalia focused on the language of the text that allowed appeals from a BRB order by “any person adversely affected or aggrieved by” the order. He emphasized that the phrase “person adversely affected or aggrieved” was a term of art dating back to New Deal statutory drafting, and that the phrase had nowhere else been construed by a court to include an agency in its regulatory or policymaking capacity.

Justice Scalia then invoked linguistic comparisons to other sections of the U.S. Code. He

noted that Congress in a number of federal statutes had explicitly conferred standing on a federal agency acting in its governmental capacity, and determined that “the LHWCA’s silence regarding the Secretary’s ability to take an appeal is significant when laid beside [those] other provisions of law.” Justice Scalia went on to reject the OWCP’s argument that the Court should reason by analogy to the similarly administered Black Lung Benefits Act, which does confer party status on the Secretary. For Justice Scalia, it was precisely the linguistic difference on this matter between LHWCA and the Black Lung statute that provided reassurance.

The opinions from Justices Stevens and Blackmun also make use of language canons, but the framework in which they are applied is rather different. In *Crandon v. United States*, the Court unanimously held that a federal law, criminalizing a government employee’s acceptance of supplemental compensation for his government service, did not apply to a severance payment made by the employee’s private employer before the recipient became a government employee. Justice Stevens’ majority opinion initially observed that, although awkwardly drafted, the literal text of section 209(a) (the conflict of interest provision at issue) supported the Court’s conclusion. But writing for six members, Justice Stevens recognized that before 1962, the disputed provision had been unambiguously limited to individuals who were already government officials or employees. In response, he relied at some length on the legislative history accompanying the 1962 revision to conclude that elimination of the unambiguous language had not been intended to broaden the Act’s coverage.

After his legislative history analysis, Justice Stevens made use of *expressio unius* and the Whole Act Rule. He noted that Congress in two other 1962 revisions to the same statute (sections 201 and 203) had inserted unambiguous language to cover preemployment payments, suggesting the absence of such language in section 209(a) was deliberate. In addition, two companion provisions to section 209(a) (sections 209(b) and (c), also added in 1962) plainly focus only on payments to employees, and the majority suggested that the scope of section 209(a) should be harmonized with that approach. Finally, Justice Stevens relied on legislative purpose, the Rule of Lenity, and agency deference to help justify the result reached by the

11 Id. at 129. Although the form of this argument (“Congress knows how to confer agency standing so we should infer it chose not to do so here”) is quite similar to *expressio unius*, Scalia’s use of interstatutory linguistic comparisons may make in pari materia the more apt canon heading. See generally William W. Buzbee, *The One-Congress Fiction in Statutory Interpretation*, 149 U. PA. L. REV. 171, 221-25 (2000) (discussing Justice Scalia’s use of this technique).

12 See 514 U.S. at 135. Justice Ginsburg, who concurred in the judgment, observed that the Court’s decision had the practical effect of imposing a disparity in the operation of two compensatory schemes—LHWCA and the Black Lung statute—that Congress had intended should work in the same way. She went through a detailed review of LHWCA amendments over the years to support her view that Congress never meant to create the disharmony in administration imposed by the Court here, but added that it was up to Congress to correct what was obviously an oversight. In *Loeffler v. Frank,* the Court ruled that an award of prejudgment interest could be made in a successful Title VII lawsuit brought against the U.S. Postal Service. Justice Blackmun relied heavily on the Court’s precedents interpreting the 1970 Postal Reorganization Act. Writing for five members, he held that in empowering the newly created Postal Service to “sue and be sued,” Congress in 1970 had wanted Postal Service liability to be the same as that of any other commercial enterprise. The majority further noted the Court’s prior decisions that this “sue and be sued” language could serve as a waiver of sovereign immunity from awards of interest that are incidental to the lawsuit itself.

Justice Blackmun’s language canon reliance came as he considered the argument that Congress in 1970 had meant for the “sue and be sued clause” to be construed narrowly with respect to interest awards. Blackmun reasoned that because Congress had included specific restrictions on the operation of the clause in several other provisions of the Act which did not cover interest payments, “the natural inference” was not to imply a restriction as regards such payments. Justice Blackmun also made use of legislative history, legislative purpose, and substantive canons to support the Court’s decision.

18 *See id.* at 166-68 (legislative purpose); 168 (substantive canon on Lenity); 164 (deference to Attorney General’s contemporaneous opinion). It is noteworthy that Justice Scalia, in an opinion concurring in the judgment (joined by Justices O’Connor and Kennedy), made more elaborate use of the same language canons, and also relied on the dictionary definition of “salary,” while eschewing reliance on legislative history or agency deference. *Id.* at 168-82.
20 *Id.* at 554-56 (relying heavily on Franchise Tax Board of Calif. v. USPS, 467 U.S. 512 (1984)).

22 *Id.* at 557.
23 *Id.* at 561-62 (legislative history); 556-57 (legislative purpose); 554-55 (substantive canon that “sue or be sued” provisos shall be liberally construed as sovereign immunity waivers in the commercial arena). Justice White’s dissent (joined by Justice O’Connor and Chief Justice Burger) relied on the appellate court opinion below, which had reasoned that the Supreme Court precedents precluded prejudgment interest in this setting.
